To ELIMINATE slow orders at spring switch locations and expedite traffic with safety, many railroads are installing "Union" Mechanical Facing Point Locks to provide the equivalent of interlocking protection for main-line train movements.

Trailing moves against the closed point are made at speeds consistent with the turnouts employed. When a train trails a switch, the flexing of the switch points causes the automatic unlock of the lock

rod to permit the trailing movement.

After the train has cleared the spring switch, the points are returned to their normal position and a powerful spring restores the locking plunger of the mechanical facing point lock in the notch of a standard lock rod. A built-in circuit controller checks the locking plunger and the points of the switch to insure that they are in their proper positions for the safety of subsequent train movements.

## WEEK AT A GLANCE

THE SAWYER REPORT: Starting on page 51 is a summary of the report on "major policy issues" in transportation presented early this week by Secretary of Commerce Charles Sawyer to President Truman in line with the latter's request of last August 30. Some of the report's recommendations, such as the one for user charges on government-provided transportation facilities, should meet with approval from all except the immediate beneficiaries of such facilities. But it is difficult to follow the reasoning behind some other suggestions in the report, e.g., possible repeal of the Bulwinkle-Reed Act. Our News pages, incidentally, report that the National Association of Railroad and Utilities Commissioners has just urged a Congressional committee not to repeal that law.

GORDON OF THE C. N.: The presidency of any big railroad is a man-sized job. And when that railroad spans a continent with a network of heavy-traffic main lines and light-traffic branches, and operates many related facilities, as does the Canadian National, the job assumes herculean proportions. The man who has held that job for nine years, Robert Charles Vaughan, will retire on January 1, to be succeeded by Donald Gordon—a newcomer to the railroad industry, but one who has already demonstrated his outstanding ability in other fields. Profile sketches of both men, and a necessarily simplified outline of C. N. problems faced by Mr. Vaughan and to be faced by Mr. Gordon, begin on page 60.

BENCHMARK: September was the first full month of the 40-hr. week and of the full Ex Parte 168 rate increase. Results for that month are analyzed, as a benchmark for the immediate future, in the editorial on page 47.

RAILWAY ENGINEERING TRAINING AT LOW EBB IN COL-LEGES: An analysis by Paul J. Claffey, civil engineering instructor at Catholic University, shows that railway engineering education is at a low level in American colleges, with few institutions offering any courses in that field beyond route surveying. Mr. Claffey's analysis appears on page 54.

ADVANTAGES OF DYNAMIC BRAKING: Beginning on page 57, J. P. Morris, assistant to vice-president of the Atchison, Topeka & Santa Fe, reports on tests of dynamic braking run by his company in both freight and passenger service, which show economies related to wheel and brake shoe wear.

PROPER CAR SELECTION CAN CUT FREIGHT DAMAGE: Has enough consideration been given to the part played by car condition in causing loss and damage to freight? Probably not, because it is easy to underrate things that can't be easily or exactly evaluated. But there is reason to believe that equipment failures and defects may have been

directly responsible for claim payments of more than \$10 million in 1948. The subject is discussed from the view-point of loss and damage prevention forces in the article beginning on page 48, which includes a list of five practices which must be followed more thoroughly if the maximum possible prevention of loss and damage due to defective equipment is to be achieved.

CHRISTMAS SHOPPING: A number of Class I railroads have been doing some Christmas shopping, with the result that our Equipment News columns report orders for 116 Diesel-electric locomotive units, 3,100 freight cars and 30 passenger-train cars. Atlantic Coast Line and Burlington were the largest individual buyers.

LET THERE BE LIGHT: A short article and picture, on page 63, tell about the new lighting in the Denver & Rio Grande Western's main offices—an installation which has resulted in better work as a result of reduced eyestrain and general fatigue.

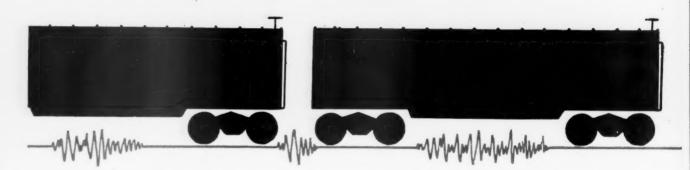

WHAT ARE THE RAILROADS FOR? The railroads' program for equality of treatment with their various competitors is not a negative effort designed solely to have such competitors restricted as the railroads themselves are restricted. But those competitors who want to keep their present advantages over the railroads have no scruples about putting that misleading and erroneous interpretation, whenever they can, on the railroads' efforts to present their own case to the public. Actually, it is not only possible but easy to interpret the railroads' situation wholly in terms of the public interest—and that is probably the only really effective way to interpret it. A summary of such an interpretation is given in our leading editorial, page 45.

GETTING WORRIED? The railroads' constant hammering at the unfairness of handing out lavish subsidies to their competitors must be getting results. At any rate, 53 major truck executives met recently at Chicago to consider a "retaliatory campaign," and Robert Ramspeck, of the Air Transport Association, devoted part of a Chicago Rotary Club talk to criticism of the railroads for trying to get a square deal for themselves. Mr. Ramspeck appears to have been trying to ride two horses; at one point in his talk he denied that air lines have hurt the railroads, and then boasted about how much first-class travel now goes by plane. Also, while denying subsidies, he described a "comprehensive program," under which the government will help the air lines achieve "safety, dependability and regularity"all of which the railroads achieve for themselves without government aid. "Comprehensive program" may be a nice new term for disguising a subsidy, but "a rose by any other name . . ." For a report of the truckers' meeting and Mr. Ramspeck's talk, see the News.

## What Are the Railroads FOR?

A friendly critic of the railroads has made the following observation to this paper: "We all know what the railroads are against—such as subsidies, and inadequate regulation of their rivals. What the public wants to know is what the railroads are for."

The railroads' position, in relation to rival agencies of transportation, is actually not the negative one of seeking to have their competition restricted. The way the industry's case is stated, however, sometimes permits interpretation in this false light. It is possible, on the contrary, to interpret the railroads situation wholly in terms of the public interest; and that is probably the only effective way to interpret it. Not many people are interested in anybody's misfortunes but their own. Strictly from the point of view of the public interest, the railroad situation might be summarized somewhat as follows:

#### In the Public Interest

1. The railroads have not raised in the investment markets any money worth mentioning for improvements and replacements, except for rolling stock and motive power, in the past nineteen years. Their only source of funds for such improvements is their net earnings. But postwar net earnings have been entirely inadequate for this purpose. The industry's net operating income was only \$780 million in 1947, a little over \$1 billion in 1948, and it will probably be less in 1949 than in 1947. These totals compare with the \$1,275 million the industry earned in 1929. The industry's net working capital, excluding materials and supplies, declined from \$1.4 billion at the end of the war in 1945 to less than \$500 million at the end of August, 1949.

2. The country cannot dispense with the services of its major railroad systems-if only (a) to handle the many commodities and between the points which truck and barge operators are unwilling or unable to serve; and (b) to provide a labor-saving transportation machine with great elasticity of capacity, to take care of the increase in the traffic load in time of military emergency.

3. Plant constantly wears out and must be replaced if the industry is not going to dry up and vanish. Since the railroads are indispensable in peacetime and desperately so in war, they must continue to have money to spend for improvements and replacements. Continuing inability to secure sufficient funds either from earnings or from investors would soon make it necessary to call upon the government to supply the deficiency. This would involve the danger of government ownership, an outcome most Americans would like to prevent.

4. There is no way of guaranteeing the country the continuance of indispensable railroad service, while preventing government ownership, except by greatly improving the net earnings of the railroads-

Y, D. F

Y AGE

thereby giving them larger resources for direct investment and/or restoring their credit so that private investors will once again be willing to supply needed funds.

5. The railroads have used the device of rate increases just about as far as they can, in the effort to secure the net earnings which the industry requires in the public interest—and the desired goal has not been achieved. There remains only one other means whereby the required net earnings can be obtained, and that is to make railroad rates more remunerative and more attractive to traffic by an approach to equalization in the financing, taxation, and regulation of the railroads, in relation to the standards maintained in these spheres for waterway, highway and air transportation.

6. The "ways" used by barges and trucks are in public ownership and are not taxed as railroad roadway is. This inequality may be remedied either (1) by freeing railroad property, except rolling stock, of all property taxes, or (2) by requiring truck and barge owners to pay the equivalent of property taxes on the public investment in long-haul highways and

waterways.

#### **Earnings** plus Taxes

7. When a railroad company wishes to improve its service by straightening out its roadway and reducing gradients, it must first earn the cost of the improvement and pay income taxes of 38 per cent on these earnings. Thus, to have \$100,000 to spend for such service improvements, the railroads must first earn \$161,000 of net income. When a highway is similarly improved, money for the purpose is simply appropriated from taxes and no additional charge devolves upon the beneficiaries of the improvement. This inequality could be remedied in part (1) by levying special tolls on commercial users of modern highways and/or (2) by exempting from income taxation all railway earnings which are reinvested in property improvements. To equalize the financing of railroad improvements with those enjoyed by users of the waterways, it would be necessary either for the federal government (a) to levy tolls for the use of the waterways or (b) to donate to the railroads for capital improvements sums comparable to those expended on the waterways, the benefit of these donations to be passed along in lower rates to railroad patrons. Railroad patrons have just as much right to expect the federal government to help them pay their freight bills as the patrons of barge lines have.

8. Because the railroads have to provide and maintain their own property, they cannot afford to put a heavier load on a piece of track or a bridge than the structure can safely withstand. Since truck operators do not own the highways they use, and since overloading is profitable for those who do not have to pay what it costs, it follows that all highways

should be restricted by law or regulation to vehicle weights they can safely withstand; that detection of violation be made reasonably certain; and that penalties be sufficiently severe to encourage compliance.

9. The railroads are expressly forbidden by law to engage in mining, manufacturing and other commercial enterprises-but other commercial enterprises are not forbidden to engage in transportation. Unless the public is willing to apply the "commodity clause" limitation to other business and not to the railroads alone, then-to relieve the railroads from an intolerable competitive handicap—the regulatory law must be changed to enable the railroads to make contract rates or utilize other devices to meet the competition of private and contract carriers, which now have no legal obligation to maintain nondiscriminatory charges. Moreover, the long-haul trucking of agricultural products should either be subject to rate regulation or railroad movement of agricultural products should enjoy a parallel exemption from regulation.

10. The Taft-Hartley Law, which governs the labor relations of all industries except the railroads, expressly forbids "featherbed" practices. The Railway Labor Act, as now interpreted, constantly expands and deepens these practices on the railroads. There can be no expectation that the railroads will approach financial and credit parity with other industries so long as disparity in regulation of com-

parative labor practices is maintained.

11. When it looks as if the air lines are not making enough money to provide a satisfactory degree of prosperity for them, the federal government simply grants them retroactive increases in payments for carrying the mail. By contrast, the railroads carry 94 per cent of the mail for less compensation than the air lines receive for carrying 6 per centa payment which is manifestly below the cost of the service. Moreover, in the face of the railroads' rapid impoverishment, the Department of Justice, so called, is endeavoring to mulct the railroads of a couple of billion dollars for alleged overcharges on wartime government freight. Thus, the federal government, while spending unprecedented billions for the expansion of other agencies of transportation, is endeavoring to extract from the railroads similarly unparalled sums. This disparity in treatment, alone, would be sufficient to account for the lack of enthusiasm of investors for committing additional funds to the railroad industry.

#### **Basis for Corrective Action**

The railroads can ask for corrective action on the foregoing points not as a favor to themselves, but as necessary in the public interest to forestall further socialization of transportation. It is not necessary to present the railroads' case as a "hard-luck story," without appeal to anyone not already sympathetically

inclined. The situation is, instead, in actual content, one involving the immediate self-interest of every American citizen. The railroads need do no more than gain general recognition of where the selfish interest of the public lies, in order to secure the correction of the worst of their handicaps.

They have, indeed, a case strong enough to invite major concessions, even, on the part of the operators of truck, barge and air lines—not because these rival carriers love the railroads, but because socialization of the railroads would put a definite end to the political advantage these other carriers now enjoy. They would be ahead of the game to make concessions of sufficient magnitude to restore the railroads' earning power and credit rather than let the railroads, also, get a pipeline into the public treasury. When and if that happens and it thus becomes possible for any pressure group to get lower railroad rates simply by voting for them—how long do the barge and long-haul truck operators think they are going to enjoy their present share of the nation's traffic volume?

# THAT SIGNIFICANT SEPTEMBER INCOME FIGURE

The \$63.5 million of net railway operating income earned by the Class I railroads in September was a great deal better than might have been expected. That month, for which adequate statistics have just become available, was the first in which the 40-hr. week for non-operating employees was effective. Since it was also the first month in which the latest advance in freight rates was effective—3.7 per cent on September 1—the September statistics may be considered a benchmark from which to evaluate the immediate future.

Net operating income is what the railroads have left, after expenses and taxes, to pay their creditors and owners and—more important to the public—to spend for improvements to their properties. For many years railroad purchases from manufacturers have followed very closely the trend of net operating income. Despite the fact that total operating revenues were less in September than in any previous month of the year, except February, net operating income was substantially higher than in five previous months, and slightly below that of the remaining three. The ratios of September's operating revenues and net operating income to those of previous months in the year are shown in the table.

September's operating ratio of 77.8 per cent was lower than that for any previous month in 1949 (compared with an average ratio of 81.1 per cent in

Month	Percentage Sept. Operating Rev. to that of Earlier Months	Percentage Sept. Net Op. Income to that of Earlier Months
Jan.	- 5	+ 37
Feb.	+ 3	+ 113
Mar.	- 6	_ 3
Apr.	- 7	- 2
May	_ 7	+ 10
June	- 6	+ 3
July	_ 1	+ 26
Aug.	- 7	- 3

the first eight months of the year and a range of from 84.3 per cent in January to 79.0 in August). Since this ratio is influenced as much by traffic levels and gross revenues as by operating expenses, the fact that a relatively low level of traffic (due in part to the start of the coal strike on September 19) brought gross revenues down to a point below that of all but one month in the year makes the showing of September's net operating income even more favorable than would appear at first glance.

Given an increase in traffic by settlement of work stoppages, the railroads' net in the immediate future should be substantially healthier than it was in September. A great deal of the traffic which did not move during the steel strike of October and during the coal strike from September 19 to November 10 and from December 1 to 3 (all inclusive), must move later. Even the current three-day work-week which John L. Lewis has imposed on coal mining cannot wholly neutralize the effect on traffic of the tremendous pent-up demand for fuel. Most economists seem to think that the "recession" of the first half of 1949 has been arrested and reversed for the short term at least. All of this should raise the level of the railroads' revenues-the "in-put" part of the ratio from which net operating income is derived.

Doubtless the impact of the 40-hr. week will be lessened even more as time goes on and managements succeed in completing the revolutionary changes in operation and administration now in process. Though inspired by the shorter work-week, these projects will have an influence far beyond the mere avoidance of hiring additional employees or accruing overtime. The railroads have found already that the new hourly pay scales brought by the shorter work-week and the retroactive seven-cents-an-hour increase, effective October 1, 1948, now make practicable and imperative a degree of mechanization which was heretofore "beyond the pale."

#### WHO SAYS "THERE AIN'T NO FEATHERBEDDING?"

"Payments collected in this docket totalled \$35,000, and it is estimated that further benefits which will stream from work train and air hose agreements will feather members' nests with \$250,000 more."

Trainman News, August 1. (Brotherhood of Railroad Trainmen weekly newspaper.)

[This article is written from the viewpoint of the loss and damage prevention forces of a major railroad, as stated to Railway Age. Prevention men from several other lines have expressed themselves in agreement with its conclusions.—Editor]

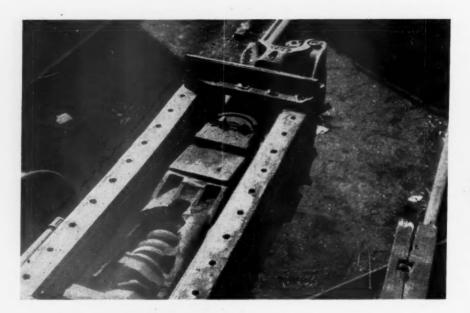

The role of the freight car in causing loss and damage to lading is not always appreciated, not easily evaluated in dollars and cents, and, therefore, to some extent may be underrated. There is reason to believe, however, that equipment failures and defects added to the railroads' freight claim bill at least \$10-12 million in 1948, since almost \$7 million can be attributed directly to the equipment (see Railway Age of June 11, page 39).

As is the case with all freight claims, it is impossible to estimate how much this meant in loss of good will to the railroad industry. Unfortunately, it is also impossible to say just how much proper maintenance of rolling stock saves the railroads in avoidance of loss and

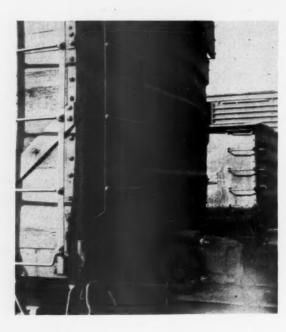

# SELECTING THE PROPER

damage. Most mechanical department men agree that improved mechanical devices and upgrading of cars do contribute to reduction of maintenance and to safety, but there is less evidence of general appreciation of what these devices can do toward cutting the bill for loss and damage.

The railroad damage-prevention man, in the course of his daily work, has many chances to see what the various defects in freight cars can do to the lading. He realizes that, of all the causes of loss and damage to freight, defective equipment is one that is directly in the power of the carriers to correct. While he recog-

Left—There's not much protection for the lading from draft gear which has been in service too long

Left—Weak draft gear has allowed the coupler horn to bent against the striker casting and is in part responsible for the terrifically bowed end of this car, as well as for damage to packaged commodities loaded in it

Right—The bowed end lining makes this car unsafe for any load which must be kept tight

# CAR PREVENTS LADING DAMAGE

The railroads' claim bill will be cut if the load is kept in mind when cars are placed for loading, say loss and damage prevention men

nizes that it is neither practicable nor economical to to have all cars graded as Class A, he feels, nevertheless, that more attention paid to what the freight car can do—and frequently does—to damage its lading can pay off in many ways.

As the prevention man sees it, there are five practices which must be prosecuted more thoroughly if the maxi-

mum possible prevention of loss and damage due to defective equipment is to be achieved. These are:

1. Better maintenance of cars and closer inspection by the mechanical department. The prevention man strenuously urges extension of programs of education for mechanical-department personnel in what to look for when inspecting and approving cars to be placed

Right—The truck springs are out of place and the tipped bolster eliminates side bearing clearance which in turn causes binding and excessive vertical shocks to lading

hat

do ety,

oss

rse

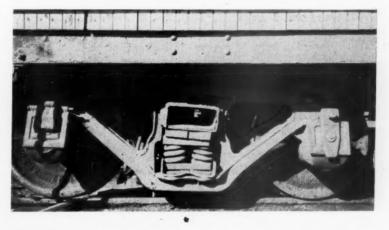

he

ıg.

ge

ly

g.

Left—Defective lining damages packaged and sacked goods and contributes to breakage from movement of loads

Below—The shine of the brake hanger suggests that though wheels are not yet excessively worn this truck is pounding enough to damage lading susceptible to vertical oscillation

for loading a particular commodity, taking into account that frequently the damage results from a combination of defects any one of which is below the recognized condemning limit.

2. Strict adherence to condemning limits as established in Association of American Railroads interchange

rules.

 Continued research to improve devices on cars, in order to better the riding quality by minimizing horizontal and vertical shocks.

4. Augmenting the program for educating operating personnel, especially agency forces, conductors and yardmasters, as to the effect that the freight car has on freight, and what to look for when selecting cars for shippers.

5. Strict application of the freight claim rule (No. 64) which penalizes the carrier furnishing unfit equipment. This necessarily involves educational programs for claim investigators and prevention men so they can readily identify damage resulting from unfit equipment.

#### **Draft Gear and Trucks**

The prevention man is convinced that one of the trouble causers is the low efficiency draft gear, which may have too much slack action due to wear, or be broken. Both defects produce roughly the same effect. The slack action of the draft gear, of course, contributes to increased vertical thrusts which in turn cause waste grabs, broken journal bearings and displaced wedges, all resulting in hot boxes, making road set-outs necessary, with the result that freight is delayed even if it is not actually damaged. (In 1948, claims paid out for delay totaled nearly \$8 million, part of which was due to hot boxes.)

Also important is the damage to the car itself that may be caused by defective draft gears. Their most serious consequence, however, is the damaging impacts to freight that may occur when the draft gear is in such condition that it can give little cushioning against such shocks. Commodities such as canned goods, porcelain enamel products-stoves and refrigerators-paper, steel on skids, etc. (1948 claim bill more than \$31 million), all are subject to shock damage, and the prevention men urge that cars placed for loading these articles have efficient draft gears. Without them a first step has been taken toward producing a claim before the car is loaded. Thus a competent car inspector pays close attention to the condition of the draft gears and endeavors to keep cars with worn or low-efficiency draft gears in services where full cushioning ability is not essential to protect the lading. By the same token, if the lading does require draft gears of peak efficiency, he limits his selection of the car to those meeting the highest standards.

#### **Combinations of Defects**

Fragile freight subject to vibration damage, such as meat on hooks, cheese, eggs, bulk flower pots, newsprint and crockery, demands a car with smooth-riding trucks. This means simply that cars into which this type of freight is loaded must be inspected to see that the wheels, axles, springs, bolsters, center plates, side bearings and snubbers are well above A.A.R. condemn-

ing limits. For example, cars with wheels having tread defects slightly short of condemning limits should not be used in such service.

Even cars with no single part worn to or defective by A.A.R. condemning limits frequently cause damage to commodities which are particularly susceptible to injury from vibration or oscillation. This is brought about by the combined effect of minor defects working in concert to create an unsatisfactory ride. Such a condition may be illustrated by assuming a car to have a pair of wheels with 2½-in. flat spots, plus truck springs with a permanent set and reduced coil height. None of the defects is sufficient to require renewal of parts, but a car in such a condition should not be selected for lading subject to damage by excessive vertical oscillation.

Progressing upward from the sills and trucks, the house-car superstructure may contribute to lading damage.

If the frame is not absolutely rigid the top portion of the box car generally moves under impact. The end walls then are not truly perpendicular at the time of heavy impact, and movement of the load is possible, with another chance for damage. Carriers, of course, try to avoid spotting a car with loose or working super-structure for loading any commodity that must be stacked high or one which will require above-center-line bracing, even though it is possible for shippers to compensate for this defect by specially bracing the upper half of the load with extra-heavy cross- and K-braces, or additional steel straps.

Leaking roofs, walls and doors cause wet damage and, frequently, cinder damage. Recently a car loaded with finished doors and window sash arrived at its destination with its lading in such shape that 81 per cent was marred by cinder scratches so deep that they could not be sanded out. The main cause of this damage was an opening all the way across the door at the top as well as a partial opening at the sides.

#### The Car Wall

The car wall plays a surprisingly large part in causing damage to freight. Prevention-conscious car inspectors do not select, or card, cars with broken or bowed end lining for commodities which must be tightly stowed. Unless the end wall is a true and flat surface, no one can keep a load tight and have, the center gate hold it uniformly. Articles in cartons or crates, or loose articles requiring even stacks have "two strikes on them" when they are loaded against broken or bowed end lining. While the side lining may not be quite as important in the production of damage, it too can chafe and tear cartons or bags, and it may allow lateral movement.

It should be evident that the prevention man's plea for the thorough application of the five practices mentioned above will help cut the claim bill and at the same time hold business on the railroads. The full necessity for this, and the eventual savings, will only begin to be evident, however, when claim investigators rigorously charge to the proper category claim payments made as a result of car defects, and when the freight-claim fraternity universally adopts the practice of placing greater responsibility for loss on the originating carrier supplying the defective equipment.

# Sawyer Report Suggests "New Concepts" in Federal Transport Policy

Numerous recommendations and suggestions call for immediate consideration of user charges for facilities provided by the government, an end to "cost-plus" subsidies for air lines, compulsory consolidation of railroads, and fixing rates on the basis of fully-distributed costs

mmediate consideration of a "general system of user charges" for transport facilities provided by the federal government, and replacement of the present "cost-plus" plan of air line subsidies with arrangements whereby such aids would be on a "fixed or gradually diminishing" basis are called for in recommendations of a transportation report which Secretary of Commerce Sawyer has submitted to President Truman. The report's numerous other recommendations and suggestions include those calling for compulsory consolidation and coordination of railroad facilities; and the making of transportation rates on a fully-distributed-cost basis, with an end to out-of-pocket rate-making except in special situations.

Like the (Hoover) Commission on Organization of the Executive Branch of the Government, Secretary Sawyer favors centralization in one agency of all federal-government "research and promotional" work and other activities in the transport field, except the regulatory functions of the independent agencies. The Hoover Commission suggested that this agency be the Department of Commerce which would thus get such I.C.C. functions as those relating to the formulation of railroad consolidation plans, car service, and safety.

While his report does not actually nominate his department for the job, Secretary Sawyer's letter of transmittal to the President says that the department has been making transport studies "on a very modest scale" for some time. The report, he adds, "clearly indicates the need for extension of this activity which, in my judgment, the department should undertake promptly." Moreover, the report suggests that the agency which had the "general responsibility for evolving the nation's basic transportation programs" in times of peace could be converted readily into a war agency with functions like those exercised during World War II by the former Office of Defense Transportation. Such a permanent agency, as the report puts it, "would appear to furnish a good nucleus for any necessary wartime-control agency or agencies."

Meanwhile, the secretary is more cautious about unification of regulation. He thinks it "probable," he says in the report, that "a consolidation of regulatory controls will eventually be necessary"; but he makes no attempt to answer the question of whether the time for such consolidation has yet arrived. The Hoover Commission failed to recommend unified regulation, thus rejecting a recommendation of the "task force" which made its transport studies.

Secretary Sawyer's report was made in response to a request from President Truman, who on August 30 asked the secretary to submit by December 1 a report "outlining the major policy issues which need to be resolved at this time in order to achieve maximum effectiveness and consistency of federal programs in the transportation field." (See Railway Age of September 17, page 92.) The President also asked for the secretary's views on the "possible desirability of having the Department of Commerce conduct, on a continuing basis, broad studies relating to federal transportation policies and programs." It was in response to the latter that the secretary expressed his view, noted above, that the department should "undertake promptly" to expand work it has been doing along that line.

#### **President's Statement**

The report was made public at the White House on December 13 with a statement from the President who said that "the issues raised . . . deserve careful consideration within the government and by the general public." "The adequacy and efficiency of our transportation services," the President continued, "have a direct impact upon the well-being of our peacetime economy, and upon our defense preparedness. It is essential that federal programs, covering a wide range of regulatory and promotional activities, make the maximum possible contribution to a healthy and balanced transportation system. I am requesting all federal agencies which have responsibility for transportation matters to give me their views on the policy questions raised in this report. With the cooperation of such agencies, immediate and continuing attention will be given to the exploration of these important problems."

The report occupies 116 double-spaced, typewritten pages. Secretary Sawyer's letter of transmittal says that the "basic materials" for the report were prepared by Dr. Paul M. Zeis and his staff, and Frank L. Barton, both of the department. The letter also reveals that the report was reviewed with three consultants: C. E. Childe, who was a member of the former Board of Investigation and Research; Dr. James E. Nelson of Washington State College, who was a member of the B.I.R. staff; and Ernest W. Williams of Columbia University. Much of the report is reminiscent of B.I.R. reports. It has, for example, discussions complaining about lack of uniformity in railroad rates and of alleged "discriminatory" rates; and predictions of prospective savings from railroad consolidations and coordinations. Also, there are arguments in favor of holding the line

on railroad regulation, or even increasing it, while discussions of regulation of highway, water and air carriers include suggestions to the effect that the present set-up may be unduly restrictive.

#### Scope of Report

This plan of presenting arguments for or against various policies or lines of action is the general pattern of the report. The secretary's recommendations are often embodied in such arguments rather than being flatly stated. The report is divided into five parts which consider, in turn: The Nature of the Federal Transportation Program; Federal Promotional Activities; Federal Regulatory Activities; Conflicts Between Federal Regulation and Promotion; and Federal Transportation Policy and National Defense.

"The basic objective of federal transportation policy," the report says at its outset, "must be the establishment and maintenance of a transportation system which is adequate to meet the growing needs of commerce, industry, and agriculture as well as those of the general public for economical and efficient transportation service. The needs of national defense are, of course, of major importance."

Brief attention is given to the development of regulation as the report finds in vogue today "new concepts" which have resulted in a "transfer of attention from the needs of the user of transportation service to the needs of the transportation industry itself." With this "new approach" placing "restrictions upon competition through control over entry into business and the exercise of minimum rate authority," the federal government "found itself fostering and promoting competition on the one hand and restricting it on the other." Added to these activities, the report continues, are subsidies to air transport and ocean shipping, which have been justified on the theory that they meet "national needs."

The discussion of this set-up includes a warning that "aid to shipping and air transportation could be carried to the point where it would weaken rail transportation services essential to national defense." A little further on, the report explains that it has not discussed federal promotional activities for railroad transportation, because the government's "principal activity" in that field is regulation. "It should be made clear, however," the report adds, "that federal transportation policy must give major attention to sound and healthy railroads as part of the transportation system."

#### **Labor Situation Not Considered**

Then come brief references to safety and labor relations in the transportation industry—subjects which are otherwise excluded from the report, because "adequate discussion" of them "would result in too long a report." So the secretary turns to his consideration of the "problem of achieving a coordinated federal transportation program." And before proceeding to suggest specific actions, he sets out these general conclusions:

"In the case of promotional activities, except in special cases where national defense considerations are urgent, the proper test of any activity is whether it results in a new or improved or more economical transportation service which is really needed. In the case of regulatory activities, the proper test of any particular regulatory program is whether it will produce for the general

public improved and low-cost services which are available to everyone on a non-discriminatory basis."

Present federal promotional activities, it is noted, involve "large and rapidly increasing expenditures," amounting now to "nearly \$1 billion a year" for the provision of "basic facilities" for water, highway and air transport. Dealing first with expenditures on waterways, the report explains briefly how the Army's Corps of Engineers justifies proposed projects on the basis of prospective "savings" to shippers. The secretary expresses his belief that the potential effect on other forms of transportation is not weighed by the engineers in reaching a decision to recommend a particular waterway project. He also has the "general impression" that "in many cases the traffic which subsequently developed on the waterway was far less than that assumed when the project was recommended."

co

fa

fo

th

S

tr

C

As to highways, the report reviews present federal-aid policies, and refers to the recent report wherein the Bureau of Public Roads recommended that 111/4 billion dollars, in addition to the present program, be spent over a period of not more than 20 years to correct "deficiencies" on roads of the so-called Interstate Highway System, which the bureau would expand from 38,000 to 40,000 mi. (See Railway Age of July 9, page 164.) This, and proposals "to enlarge the federal share of highway improvement costs," prompted the secretary to suggest that more attention be given to "striking an appropriate balance between federal, state, and local activities in the highway field." Many highways now eligible for federal aid "might be considered of secondary importance from a national standpoint," Mr. Sawver adds.

#### "Free Hands" on Promotion

The principal emphasis of his discussion of expenditures on airways and airports is on the fact that the Civil Aeronautics Administration is there functioning under statutes which fail to provide "clear guideposts." The federal-aid airport program, for example, leaves the administrator of C.A.A. "with a virtually free hand to determine what airports should be built and where they should be built."

This "free hand" attribute, however, is not peculiar to C.A.A. The report's summary of its discussion of the facilities programs notes that "the promoting agencies have for the most part only very broad and general standards established for them by statute." With each agency thus made "judge of the merits of its own promotional activities," it has "naturally become convinced of their great importance," the summary adds. It goes on to say that there has been "little coordination" of the facilities programs; and that, where the facilities are provided without charge, it is "difficult to measure the utility of the separate programs in terms of the willingness of users to pay for the use of the facility." This brings the secretary to his call for immediate consideration of a "general system of user charges."

"Careful study," the report says, "should be made of the areas in which user charges are not now in effect. In those areas such as roads in which user charges already apply, it is desirable to determine whether each type of user is paying his fair share. Since the facilities are provided for the benefit of transportation users directly or for the benefit of transportation companies who in turn supply services for the using public, it

might be desirable for the government to recapture an important part, and in some cases, all of its expenditures. In some cases, of course, defense considerations or the need to accelerate development of particular services or areas may temporarily justify furnishing facilities at government expense.

"The imposition of charges, moreover, could provide concrete evidence of the actual value of the various aids which are being supplied. Failure of the users to utilize facilities for which some charge was made would suggest that such facilities are not economically justified. On the other hand, the prompt and adequate payment for other facilities might suggest that additional emphasis be placed on those parts of the program which the public was willing to support. It is recognized that wider imposition of user charges raises complicated problems which need to be explored. Nonetheless, the federal government should undertake to study and resolve the issue of assessing user charges."

#### Subsidies to Air Lines

Leading into its recommendation that the "cost-plus" system of subsidies to air lines be abandoned, the report says that routes now served by the subsidized carriers indicate "optimistic assumptions" on the part of the Civil Aeronautics Board as to "the speed with which air transportation would develop new markets or penetrate old ones." Also, it is stated that the board's promotion of competition has been a promotion of competition between air lines already in existence when the Civil Aeronautics Act was passed. "Relatively few newcomers," the report adds, "have been certificated for any routes other than feeder lines of low traffic density. Moreover, companies affiiliated with other forms of transportation, such as railroads and steamship lines, have experienced little success in obtaining certificates for air transport services."

The "cost-plus" system of air line subsidies is described as a plan under which individual lines are "virtually guaranteed against bankruptcy." This has resulted in air mail payments for trunk-line carriers ranging in 1948 from 60 cents to \$22 per mail ton-mile. In the case of some feeder lines, the payments reached "more than \$70" per ton-mile. These variations indicate to Secretary Sawyer that some of the air lines "are operating routes which have little immediate prospect of being placed on a self-sustaining basis." This situation, he adds, "has a definite bearing upon the financial revenues of the railroads and other common carriers and intensifies the problems of the regulatory authorities who are concerned with the maintenance of a sound surface transport system."

All of which, as the secretary puts it, "raises the question which must ultimately be faced as to when subsidies to air transportation companies should be terminated." As a first step, he suggests that "subsidy payments should be determined and paid separately and not concealed in payments for air-mail service." One means of dealing further with the problem, he continues, is to replace the "need clause" of the Civil Aeronautics Act with new provisions "empowering the regulatory agency to establish in advance subsidies at fixed rates for a given time for groups or classes of carriers. An additional consideration is whether the regulatory authorities should have more definite powers than now exist to terminate subsidy payments in cases where it becomes clear that the particular service is not render-

ing a significant contribution to either the needs of commerce or those of national defense."

Later on, the report suggests that transport subsidies based on national defense should "wherever practicable" be charged to the budget of the National Military Establishment. There is also a brief reference to the government-owned Inland Waterways Corporation, operator of the Federal Barge Lines. Since this service has been operated at a loss, the operation "must be regarded as an indirect subsidy to the users of the service."

The recommendation that all major promotional activities be grouped in one agency for "unified direction and control" is based generally on the report's finding of a "need for re-examination" of such activities. Secretary Sawyer then proceeds to his consideration of federal regulatory activities. First, he looks over the effect of regulation on service, and finds it generally good.

"In the area of regulation of service," he says, "it appears clear that the regulatory process has met with considerable success. Most of the discriminatory practices formerly complained of have disappeared and transport users are normally supplied with the equipment they need on an equitable basis."

There is no such good word for the rate structure which is called a "mass of inconsistencies and inequalities." As "one step to improve the situation" it is suggested that consideration be given to the "restoration of penalties in the law for failure on the part of a common carrier to quote the proper rate." Such provisions, formerly in section 6 of the Interstate Commerce Act, were repealed by the Transportation Act of 1940.

"Rate discrimination" is next discussed; and there it is found that the present structure "compels some users to pay substantially higher rates than would otherwise be required in order to compensate for underpayment by others for transportation services which are rendered." Payment by carload shippers for the "substantial deficits" incurred in railroad passenger and l.c.l. operations is cited as an example. As part of a "careful re-examination of the small shipment and l.c.l. situation," the report suggests that consideration be given to l.C.C. Commissioner Alldredge's proposal to eliminate express operations and divert the present express traffic to parcel post and expedited l.c.l. freight services.

#### The B.I.R. Influence

Other rate "discriminations" listed include those allegedly resulting from different bases of rates on different commodities and from the different rate scales in the various territories. B. I. R. studies are cited in support of these allegations, and there is also a suggestion that "studies on a continuing basis showing the rates actually paid by shippers should be made." The general rate increases of recent years are found to have multiplied the "discriminations and inequities which already existed." Next there is complaint about "delays in correcting discriminations," it being pointed out that uniform classification and uniform class-rate scale prescribed by the I.C.C. in the Nos. 28310 and 28300 proceedings have not yet become effective.

Then comes the argument in favor of rates based on fully-distributed costs. "While the out-of-pocket theory is attractive to the individual carriers confronted with an immediate situation," the argument says, "it should not have a similar attractiveness for a regulatory agency (Continued on page 66)

Author suggests remedy as survey shows that only 5 schools, of a total of 122 that afford civil engineering curricula, place emphasis on railroads

# Most U. S. Colleges Shun Railroad Engineering

Railway engineering education it at a low level in the United States. Few of the nation's colleges offer engineering students more in the field of railway engineering than route surveying.

There are 122 schools in the country that provide civil engineering curricula. Of these only 5 place emphasis on railroads and only 10 others provide as many as one or two courses in railway engineering. This leaves 107 technical schools that offer no courses, either undergraduate or graduate, dealing with the problems of railway construction, maintenance or operation. On the other hand, 39 of these schools place emphasis on highway engineering and 73 give one or two courses devoted specifically to highway construction and maintenance, traffic, and administration. Nineteen colleges offer one or two courses in airport construction and design. None of the schools offers courses on waterway transportation, as such, but all offer work on heavy construction, such as docks, wharves, canal locks and breakwaters that are included in the facilities of waterway transport. Railway engineering, which requires the highest type engineer, is ignored by 87 per cent of the schools, while engineering courses in the other types of transport are provided by the majority of engineering colleges.

What are the railway engineering courses that are taught? Route engineering as taught in 93 schools is an advanced surveying course devoted to locating routes for railways, highways, canals, pipe lines, etc. Route surveying covers preliminary location, the laying out of simple, compound and spiral curves, and earthwork calculations. It is not a railway course, but the railroads use the same methods for laying out curves and for grading as other route lines.

The five schools which emphasize railroads are Cornell University, University of Illinois, University of Michigan, Michigan State College, and University of Minnesota. These schools offer courses in four or more of the following subjects: (1) Railway maintenance of way; (2) railway location and design; (3) railway operation and management; (4) railway research; (5) railway signaling; (6) railway terminals; and (7) railway economics and administration. These schools may graduate students with a Bachelor of Science Degree either in railway engineering or in civil engineering with railway option. It is in these five places only that railroad engineering is taught in any adequate manner.

The course provided by schools that give only one or two railroad courses is of a general nature. All the varied facets of railroad engineering are covered

lightly in one term. For example, the Civil Engineering department of Catholic University of America, at Washington, D. C., requires seniors to take a 16-week railroad course (1 semester) with two hours of class each week. Motive power, train resistance, valuation, yard layout, signaling, train rules, and maintenance of roadway and track are all taught, but in a necessarily sketchy manner.

#### Many Schools Emphasize Highways

Where highway engineering is emphasized, three or more of the following subjects are taught: (1) Pavements and materials; (2) highway traffic engineering; (3) highway finance and administration; and (4) highway soil engineering. Where highways are not emphasized, most colleges offer one or more general highway engineering courses. In most cases the subject-matter in these courses covers types of pavements, drainage, visibility, lighting, traffic control and highway financing. Courses on airports are design courses on proper location of ports, position of runways, airport buildings and control structures.

General transportation courses taught in 29 of the schools embrace instruction on problems of all major

types of transport, brief description of each, and a study of their interrelationship and coordination. It is evident that for their size and the extent of their engineering operations and number of engineers employed, the railroads are not adequately treated in the technical schools

Colleges, with few exceptions, will provide courses for which there is a demand. Many courses on electronics, air conditioning, aeronautics and construction are offered by most technical schools primarily because large numbers of graduates enter these fields and students want these courses and take an interest in them. Schools will provide courses in railway engineering if there is sufficient student demand or interest. But the students do not want railway engineering courses. They consider them a waste of time since very few civil engineering students plan railroad careers.

It is apparent to anyone dealing with engineering students that most of them are almost antagonistic towards the railroad industry. Low salaries, slow advancement, seniority and long hours are among the reasons expressed by students for this attitude. But the outstanding reason, not often expressed, is a fear of insecurity, based on the pessimistic assumption that the railroads are on the way out, and that their func-

<sup>\*</sup> No catalogue of courses for year 1948-49

tions will shortly be taken over by trucks, buses, pipe lines and airplanes. Graduates do not want to tie their futures to an industry they feel is losing out to competitive industries.

IES

The railroads should do something about this situation. They must increasingly depend on college graduates for engineering and supervisory positions because today the type of man the railroads want and need does not end his education with high school as in the past, but goes on to college. Railroad managements are realizing this, since it is becoming more difficult for them to find in the ranks of their employees men suited by temperament or ability for supervisory work. Another point that should not be forgotten is that most engineering students will eventually find their way into positions of responsibility in industries and concerns that provide the bulk of railroad traffic. Unless they study the problems of transportation and the railroads in school, they will take with them as graduates erroneous ideas of railway transport and its relationship to industry.

The remedy is to explain and demonstrate to students the true position of the railways, and to convince them that the railroads are now, and will continue for many years, a vital part of the nation's economy. The advantages of railway work and the actual opportunities for advancement must be made clear to the students. More railroads should have men on their staffs speak before the students of colleges situated along or near their lines, at least once every year. Student engineering societies are continually looking for interesting speakers from industry and will welcome such action on the part of nearby roads. Another excellent means of putting the railway position before students is for the railway companies to present subscriptions to Railway Age and other factual railway magazines to college engineering libraries.

If the railroads can awaken the interest of students in the problems of basic transportation, more schools will provide courses in railway engineering, and engineering graduates in the future will have a more enlightened and favorable attitude toward the railroads.

# Advantages of DYNAMIC BRAKING

Tests run in both freight and passenger service show economies that are related to wheel and brake shoe wear

The Diesel locomotive with its high availability has distinct advantages in additional savings that are generally not credited to the reduction in locomotive operating and maintenance costs. One of these is the dynamic brake, which has generally not been taken full advantage of.

In view of the fact that material and labor costs were increasing, we on the Santa Fe decided that we would make a survey to determine where it would be best to reduce our costs when possible. We decided that, having made substantial savings by the use of the dynamic brake in heavy-grade territories, we would see what the savings would be in the level territories.

We took into account the first test made with an Electro-Motive demonstrator locomotive equipped with the dynamic brake. In January and February, 1940, an order for five of that type of locomotive was placed for the Santa Fe. The dynamic brake applied to those five locomotives was the two-stage brake with two operating positions (B-1 and B-2) on the brake controller. It was necessary to reduce the speed by the use of the air brake to a definite point before application of the electric brake. The characteristics of the brake were as follows:

| Gear Ratio and Wheel Diameter 59/18-40 in. 61/16-40 in.

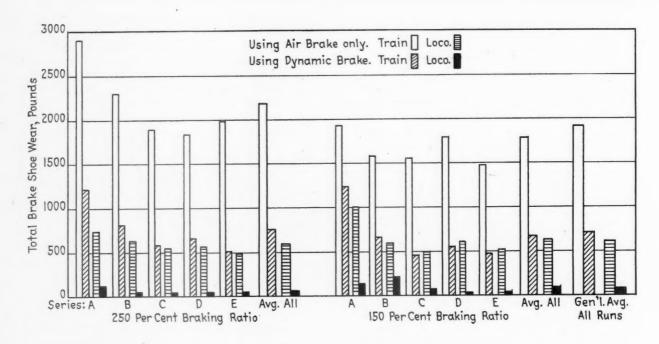

By J. P. MORRIS Assistant to vice-president Atchison, Topeka & Santa Fe

| Gear Ratio and Wheel Diameter | 59/18-40 in. | 61/16-40 in. | 61

The original brake was a holding brake with limited functions and its major accomplishments were: (1) by test it was found the dynamic brake absorbed from 25 per cent to 50 per cent of the energy formerly required of the air brakes to control the speed of trains on heavy descending grades; (2) reduction in brake

on heavy descending grades; (2) reduction in brake shoe and wheel wear; (3) elimination of stops formerly made to cool wheels and brake shoes; and (4) a saving of time of approximately one hour in each direction between Winslow, Ariz., and San Bernardino, Cal.

While these results were encouraging, it was felt that additional benefit could be gained on the Santa Fe by the development of a multi-stage brake. In October, 1941, the perfected multi-stage brake suitable for all operating grade conditions and with an operating speed range of 10 to 60 m.p.h. in freight service was developed. With this brake, the motor field circuits are connected in series to the main generator. When the controller is

Total	2,539.1	793.3	1,745.8

moved to the braking position, the motor field circuits are reversed and the motors become generators. Movement of the brake controller varies excitation of the field circuits and the armature current generated is dissipated through fan controlled grids.

#### **Application to Freight Locomotives**

The first brake of this type applied to Santa Fe locomotives was on a 5,400-hp. Diesel freight locomotive in service in March, 1942, and it has been applied on all locomotives delivered since, both freight and passenger.

A summary of early tests of both the two-stage and multi-stage dynamic brake as compared with the air brake for controlling trains on heavy descending grades is given in Table 1. The results of the use of the dynamic brake are reflected in the records of slid-flat and brake-burned wheels. A comparison of statistics on these items for two six-year periods, before and after inauguration of the dynamic brake, is shown in Table 2.

As a result of experience gained in the use of the dynamic brake in heavy-grade territory the Santa Fe undertook extension of its use for control of train speeds on all territories, both on level and on descending grades.

Beginning in the fall of 1948 and extending into May, 1949, a series of road braking tests of high-speed passenger trains were made and in order to get complete information, the dynamometer car was used to record the data from which information could be developed as to the practical use of the dynamic brake on all territories.

A series of test runs were made on the "El Capitan,"

a lightweight, streamline, all-coach train between Chicago and Los Angeles, operating on a 39-hr. 45-min. schedule for the 2,227-mi. run. Two series of test runs were made, one using 150 per cent braking ratio on the passenger cars without high-speed governor control, and the other with 250 per cent braking ratio on the passenger cars with high-speed governor control. Five round-trips were made in each series, using air brakes only, and five round-trips using dynamic brake everywhere possible, supplementing with air brakes when necessary. On each of the round trips, a different type and size of brake shoe was used on the passenger cars.

The detail data from the 20 round trips or approximately 90,000 miles of road testing are now being analyzed to evaluate the merits of various brake shoes used.

Table 3 shows the comparative results accomplished with the use of the dynamic brake in reducing brake shoe wear. Data for all runs have been equated to an average 13-car train. With full use of the dynamic brake everywhere possible, the average values for all runs show a reduction of 96.0 per cent in train brake shoe wear and 87 per cent in locomotive brake shoe wear. Similar test runs made on freight trains on three different territories gave the data shown in Table 4.

As a result of the tests, bulletined instructions have been issued to all enginemen with a copy of the chart covering the detail method of using the dynamic brake for controlling the speed of passenger and freight trains.

These instructions give the sequence of operations for applying the dynamic brake on Electro-Motive, Alco and Fairbanks-Morse locomotives. The instructions make it mandatory to use the dynamic brake wherever possible. They also provide that the standard instructions for maintaining and operating air-brake equipment are applicable when using air brakes on trains in conjunction with the dynamic brake on the locomotive.

During the test runs, particular attention was paid to the handling given the train for smoothness of operation. In general there was little rough handling or shock due to slack action from the use of the dynamic brake.

#### The Economic Value

The economic value of the dynamic brake may be summed up as follows:

- 1. Reduction in the number of overheated wheels in freight equipment as well as passenger equipment.
- 2. Elimination of long and costly stops for wheel cooling in heavy grade territories.
- 3. Reduction in the number of thermal cracked wheels.
- 4. Reduction in wheel wear as a result of reducing the use of the brake shoes against the wheels to a minimum.
- Reduction of wearing in parts of the brake rigging and attachments.
- Reduction in the number of failures of brake beams and brake beam attachments.
- 7. Reduction in the number of derailments caused by failures of brake beams and brake beam attachments.
- 8. The ability to reduce the speed of the train with the dynamic brake and air brake in conjunction thereto without the attendant brake shoe and wheel damage.
- Better train handling in regard to slack action where the dynamic brake is properly used.

#### TABLE 4 - TEST RUNS IN FREIGHT SERVICE

Corwith, Ill., to Argentine, Kan., with threeunit locomotive, 4,050 hp., handling 75 cars, 2,625 tons, westbound; 80 cars, 4,000 tons, eastbound, 447 miles each way. Brake shoe wear, lb. per round trip

TrainLocomotive		Dynamic plus air brake 174.9 30.0	Reduction 126.2 18.0
Total	349.1	204.9	144.2

Argentine, Kan., to Cleburne, Tex., with threeunit locomotive 4,050 hp., handling 60 cars, 3,000 tons in both directions, 579 miles. Brake shoe wear, lb. per round trip

rain		Dynamic plus air brake 67.2	Reduction 167.8
ocomotive	24.0	15.5	8.5
Total	259 0	82 7	176.3

Belen, N. M., to San Bernardino, Cal., with four-unit locamotive, 5,400 hp., handling 80 cars, 3,500 tons in both directions, 723 miles. Brake shoe wear, lb. per round trip

Ţrain	only 1,094.4	air brake 416.0	Reduction 678.4
Locomotive	245.1	40.4	204.7
Total	1.339.5	456.4	883.1

Of these items, the thermal cracked wheel condition existing on American railroads is one that has given railroad officers a great deal of concern, for the wheel manufacturers have not as yet developed a wheel that is free from thermal cracking when subjected to the heat imposed by the use of brake shoes applied to the wheels.

The dynamic brake offers positive relief from this condition and if used conscientiously by engine crews, it will reduce the number of thermal cracked wheels, which in the past have proved very costly not only from the standpoint of the labor involved in removing, turning and remounting of the wheels, but from the hazard involved due to wheel failures which generally result in derailments and accidents.

YE OLD ENGLISH TAVERN CARS, introduced into service this past summer on Britain's nationalized railroads, have failed to find popularity with the public, and in general have aroused derision and jesting criticism in newspapers and magazines of all types and political persuasion. It is possible, however, that they may prove popular with American tourists

Mr. Gordon (left) and Mr. Vaughan look over a map of the C. N. system

# Donald Gordon to Succeed R. C. Vaughan As Canadian National Head

The new president will draw upon his administrative and financial background to cope with the complexities of a government-owned railway

On December 31, 1949, Robert Charles Vaughan will retire as president and chairman of the board of the Canadian National Railway System, a position he has held for nine years. He is to be succeeded by Donald Gordon—a man who may be a stranger to some railroaders but whose name was as familiar to Canadian householders for several years of wartime austerity as their own. Both men gathered respect for their abilities while still young men. Both worked their own way up. Were the term "Horatio Alger" not overused already, it would be appropriate to use it here.

The structure of the Canadian National family, the leadership of which Mr. Gordon will inherit from Mr. Vaughan, is complex—comprising as it does a myriad of services. Each has its diversified problems which must be dealt with. It is no small inheritance.

The position of president and chairman of the board of such an organization is no job for a shy man, nor for one who ruffles easily. Not only must the man be capable of overseeing the many activities of the C. N. System, but at the end of each year he must explain and justify, item by item, the year's earnings and expenditures at a face-to-face meeting with a Parliamentary committee, the committee which must consider and approve the appropriation to be made by Parliament toward the road's expenses for the next year.

#### The Financial Problem

The Canadian National System was formed in 1923 as successor to the amalgamation of government-owned lines with a number of railroads on the verge of bankruptcy. Since its very inception it has had a hard time of it financially. When taken over by the government three of the corporations were insolvent and there was a backlog of deferred maintenance.

Three factors, the C. N. management feels, keep it operating for the most part at a loss. First, had the predecessor roads not been denied the recourse of receivership, it is possible that the fixed-charge debt would have been adjusted downward in line with a

reasonable earning potential. As it was, when the Canadian National System was formed, the government took the position that the investors should be protected against loss, and the funded public debts of the embarrassed companies were carried on as obligations of the new organization.

On December 31, 1922, the principal amount of funded debt held by the public was \$804,503,144, with annual fixed charges of \$35,623,415. At its very outset, the management felt it was strangled by a debt even the interest on which was beyond the earning capacity of the road.

A second further financial drain is the obligation to operate a considerable mileage of marginal and non-paying lines. Many C. N. lines compete with each other. Much mileage is useless for the purpose originally intended; nevertheless the road is required to continue its operation either in the public interest or because it traverses country in the process of development. Of its 23,300 miles of track the C. N. makes the following classification with regard to earnings:

 More than self-sustaining
 10,500 miles

 Marginal
 7,100 miles

 Sub-marginal
 5,700 miles

The third element which affects the Canadian National's financial situation unfavorably is the fact that freight rates have not kept pace with the increased costs of labor and materials. Relief has been granted several times but too little and too late. A further rate increase application is pending.

The Canadian National in its current submission to the Royal Commission on Transportation, which is exploring the national transportation policy, makes some recommendations of its own as to how its situation might be remedied and how the system might eventually operate more nearly within its income. Its management contends that by the very nature of its organization it not only was committed to an indefinite period of recurring deficits, but was denied also the opportunity to make surplus earnings with which to reduce interest-bearing debts. The company has asked the Royal Commission, as it had previously requested Parliament, to approve

an arrangement under which debt reduction may be accomplished. The road further asks an adjustment in rates and charges to compensate more adequately for increased costs of services.

This, then, is an oversimplification of the problems confronting the Canadian National and its president. What of the men confronted daily with the practical aspects of such matters?

#### Mr. Vaughan's Career as President

Much of Mr. Vaughan's term as president has revolved around the decisions and adjustments of a wartime economy with the reactions that accompanied the transition to peacetime operation. Traffic, revenues, and costs all increased tremendously. There was the necessity to improve and add to existing plant, a matter of great difficulty under war conditions.

In addition to transportation Canadian National subsidiaries were engaged in other war work. Several freight vessels were constructed, dry dock facilities turned to war repairs, and guns and gun carriages were manufactured. It was necessary also to construct tracks, yards, spurs, sidings and shops for war plants.

Large scale improvement plans were of necessity abandoned during the war years. In addition to a few minor line extensions, however, one branch planned under Mr. Vaughan's direction has been partially completed. This is the 55-mile line in Quebec from Barraute to Kiask Falls. Surveyed in 1946, 39 miles are now completed.

Mr. Vaughan at first meeting has been described as a little austere, though cordial and polite—more apt to listen, then comment, than he is to volunteer. His forte for putting a visitor at ease lies in the fact that having traveled almost constantly since he was eighteen he is quite apt to know well the section of the country his visitor comes from and some of its citizens.

Mr. Vaughan is known to those immediately under him as a perfectionist—exacting but human—a man to whom second best is not enough. The feeling for "the old man" is one of admiration for a man who has worked up from a messenger to president and learned the sound way of doing things all along the line.

Born in Toronto on December 1, 1883, the son of Irish parents, young Vaughan went to neighborhood public schools and then to Harbord Collegiate Institute. He most enjoyed math and geography, but he must have done well in other subjects for he entered the third form at Harbord at the age of twelve.

When he was fourteen life became more serious. With the compulsion that at that age a man should be getting on in the world, Vaughan went to work as a messenger for the Canadian Pacific at the self-supporting sum (then) of \$10 a month. Later he went to night school, studying accounting and shorthand. When eventually he joined the staff of the Canadian Northern (a predecessor of the Canadian National) the night school work coupled with his railroad experience led to his appointment as secretary to D. B. Hanna, then vice-president and general manager. Of that period Mr. Vaughan says, "We didn't have much fun but it didn't do us any harm."

Mr. Vaughan digressed from railroading only once, and that period was brief. An uncle of his had a ranch in what used to be the North West Territories and Vaughan spent six months with his uncle—as a cowboy.

He says he liked the life but realized that more capital than he had was necessary to make it a permanent thing. Back to railroading he came, with a job in a freighthouse on the Grand Trunk.

It was in 1903 that he joined the Canadian Northern. At the age of twenty-seven he became assistant to the vice-president and general manager. In 1918, just prior to the government-operation era, he was appointed assistant to the president, and two years later became vice-president.

As vice-president in charge of purchases and stores and steamships from 1920 to 1940, Mr. Vaughan achieved for himself a reputation as a businessman. Word got around of his ability as a canny buyer and user of products and his penchant for making a dollar do a dollar's work. In July, 1939, Mr. Vaughan was called to Ottawa by the government to become chairman of the Defense Purchasing Board, later known as the War Supply Board. In time this board was reorganized into the Department of Munitions and Supply, which, during its existence, was one of the largest departments of the Canadian government.

Mr. Vaughan was appointed president of the Canadian National, Central Vermont, Grand Trunk Western, Canadian National (West Indies) Steamships, and director of Trans-Canada Air Lines in 1941, replacing Samuel J. Hungerford, who remained chairman of the board. Mr. Vaughan became chairman and president of the Canadian National, Central Vermont, and Grand Trunk Western the following year, bearing the responsibilities of this position through the hardships of the war years and the transition to peacetime operations.

#### Not "All Work and No Play"

In the days before railroading became his exacting taskmaster, he had time for many enthusiasms. He liked sports—went in for baseball, lacrosse, football and hockey in their seasons. Summers he enjoyed swimming and canoeing.

His pleasures now are simple and quiet: radio programs, driving his car when gasoline shortages are not a problem. His reading for the most part lies in biography and economics, although he admits to a detective story or two now and then. He is reputed to like a game of bridge, but says modestly that his golf score is no better than average.

Despite Mr. Vaughan's preoccupation with his work, he yet finds time to give to his community. He serves as a member of the national advisory committee of the Canadian Red Cross, honorary advisory director of the Health League of Canada, and governor of Montreal General Hospital. He is president of the Railway Association of Canada, honorary president of the C. N. R. War Vets Association, and belongs to several clubs. An award Mr. Vaughan prizes is that of Companion of the Order of St. Michael and St. George, made on the King's Honors List, Dominion Day, 1946, for his contribution to the war effort.

His one ambition along the line, Mr. Vaughan says, has been to make the people of Canada proud of the Canadian National because they, the people of Canada, own it.

Among the things one remembers after a conversation with Donald Gordon are a dry, quick wit, forceful directness, a keen interest in world affairs, and the potential

Donald Gordon

to accomplish a great deal quickly and quietly. Those who have worked under him remark that the reason he always has time for one more thing is his ability to stick to the matter at hand without sliding off on a tangent.

Donald Gordon was born in Scotland on December 11, 1901. His father was a watch-maker of Old Meldrum, Aberdeenshire, before he packed his family of six off to Toronto to live. At first, Donald, thirteen at the time, was the sole wage earner of the family. A job in a box factory, pulling out box ends after they had been cut, brought in \$6 a week. That lasted only until the truant officer caught up with young Donald and pointed him back toward the portals of learning. At last reaching the legal school-leaving age of fourteen, he went to work again, first as a blacksmith's helper, then as an electrician's helper.

Donald discovered that a magazine delivery route could be very profitable, and that if one was good two or three were even better. So he invested in a bicycle, which solved part of his problem. Enterprise on his part took care of the transporting of so many magazines. In those days of open-end street cars Donald was able to heave his bundle of magazines on to the rear end of a car, beat the car across town on his bicycle, and then retrieve his magazines. It worked, too—for a while.

Gordon's school principal took an interest in this former student and told him of an opening as clerk in the Bank of Nova Scotia, a job he accepted with alacrity in 1916. Donald Gordon profited from what might have been a dull eight years by going to night school. He took correspondence courses, too, as well as some of the bank's own extra-mural courses, giving himself the equivalent of university training. Within four years he was working in the head office, and in 1924 joined the bank's inspection staff.

During an inspection trip in 1925, Mr. Gordon missed his train out of St. Stephen, N. B. Taking the next train, he found friends aboard who introduced him to a young lady from Newfoundland, named Maisie Barter. It was a train well-missed. Within a year Miss Barter became Mrs. Gordon, and thus began what their friends refer to as "the Gordon team." Donald Gordon says a bit wryly that his wife has an "infuriating effrontery" to believe that he can do anything he sets his mind to.

Otherwise, he says, being naturally inclined to laziness the might have had a nice peaceful life.

In 1926, he became assistant chief accountant of the Bank of Nova Scotia, and in 1930 was made assistant manager of the Toronto branch. It was in this position that he came to the attention of Graham Towers, governor of the newly formed Bank of Canada. Mr. Gordon became secretary of the Bank of Canada under Mr. Towers in 1935 and became deputy governor three years later. It is said of the Towers-Gordon partnership: "Towers, the leader of ideas, the 'scientist' of finance; Gordon, the practical banker and administrator."

#### Two Difficult Administrative Jobs

When the war came in 1939, the governor of the Bank of Canada and his deputy had already worked out the principles of foreign exchange control and the administrative machinery from which evolved Canada's Foreign Exchange Control Board. Adoption of this exchange control policy, at a time when Canada was running behind on international trade at an alarming rate, has been credited with preventing collapse of the Canadian dollar.

In 1941 came the beginning of Donald Gordon's next big job. Canada had been using all the traditional methods to fight inflation, to no satisfactory avail. In the minds of a group of officials in Ottawa grew the possibility of winning the battle against runaway inflation by a complete freeze of all prices. Donald Gordon was suggested for the job of organization of such a system, refused, but finally, in the name of war duty, was prevailed upon by Prime Minister King, who already had announced that price controls would go into effect December 1, 1941. Under Mr. Gordon's weaving grew the tapestry of a war-emergency price control system which helped keep Canada on the black side of the books, and which system came in for study by Donald Nelson and Leon Henderson when the United States set up its own price control system.

After the arduous tasks of foreign exchange control and price control administration had been completed, and with the ending of the war, Mr. Gordon returned his full attention to the Bank of Canada, until the announcement on October 11, 1949, that he had been appointed to succeed R. C. Vaughan as president of the Canadian National. Later he was named also chairman of the board. Since that time Mr. Gordon has been engaged in an intensive study of the C. N. system, from the earliest days to the present.

When asked if he welcomed the change from the financial field to railroading, Mr. Gordon stated that he is "always excited by a new challenge" but that there would not be a terrific change, since the motivation behind both the banking system and the Canadian National "is to develop the country. What helps the country helps the Canadian National, and the converse."

Like Mr. Vaughan, Mr. Gordon has been too busy along the line to get in much play. If one is to believe what one hears, however, life around Mr. Gordon is seldom stodgy or dull, even during business hours. His sense of humor is never very far away, but the fun he pokes is more often directed at himself than at others.

Mr. Gordon's ideas of fun are both quiet and noisy. When he doesn't have to do homework evenings, he may go in for a novel—says Orwell's "1984" was really

something. He reads "whodunits" and frankly admits "the more blood and bodies, the better." He enjoys poetry, particularly that of Robert Burns. He likes music, both to listen to and to join in on, and has been known to sing Scotch airs with a minimum of urging by friends. Apparently there are differing schools on appraising the quality of his musical ability—the chief derrogation (attributed to an Irish, and therefore, dubious, friend) being that Donald Gordon's song certainly lacks not when it comes to volume. He plays a little bridge also.

Along the athletic line, Mr. Gordon, according to his wife, used to be an expert canoer. He played a little golf before the war but hasn't been out since.

The Gordon's favorite place for relaxation is their 150-acre "bush-lot" some fifteen miles northeast of Ottawa, where Donald Gordon has appeased his creative bent with all manner of carpentry. Entirely isolated, the property boasts a small lake in its dead center. On the lake is a 35-foot floating "island," resting on steel drums

and supporting a full size "genuine Dutch windmill." Inside the room in the windmill is a bed, from which one can fish in comfort through a trapdoor opening down into the lake.

His attitude toward people is that it's the individual who matters. He feels that the worker must be given a feeling that he is valuable as an individual personality, that the employee believe that the boss cares about his welfare and aspirations. An attribute that has won for Donald Gordon many friends, according to those who know him, is his always having had time for others and sympathy for their problems.

Regarding the economic future of Canada and its reflection on the railways Mr. Gordon comments: "It is only necessary to review the economic and railway development of Canada during the first half of the present century to believe that such development in the second half will be no less great, proportionately. I have unbounded faith in the future of this country, and it is shared by most Canadians."

# D. & R. G. W. IMPROVES WORKING CONDITIONS WITH BETTER LIGHTING

mproved lighting as an aid to better vision and better work is a part of the rebuilding and modernizing program of the D. & R. G. W. in relighting its main offices in Denver, Colo.

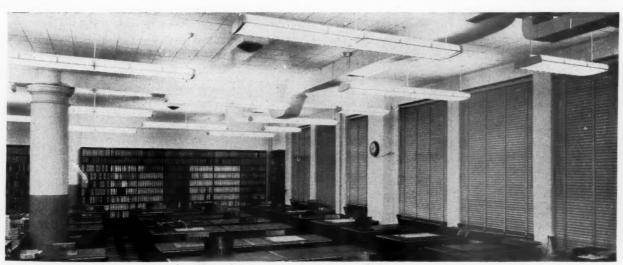

The old, six-lamp, 40-watt incandescent fixtures formerly used in the administration building offices have been replaced by Grenadier fluorescent fixtures which provide well-diffused light with an initial intensity of 50 footcandles on a horizontal plane at the desk tops. The new installation has practically eliminated glare and this has been found particularly important in one department where thousands of passenger tickets with shiny surfaces had made fatigue from glare and under-

lighting a serious condition. The new lighting has also disposed of difficulty in checking way bills, some of which are written faintly in pencil. Headaches due to eye strain in that department were common before the fluorescent installation improved the seeing conditions.

The fixtures are suspended from the ceiling in a staggered arrangement, with a distance of 8 ft. 3 in. between rows, and 8 ft. between the ends of the 8-ft. fixtures. Pneumatic tubes and air conditioning ducts on the ceiling made it impractical to utilize continuous rows. The mounting height is 11 ft. above the floor. The lamps are 3,500 deg. K white, with two 40-watt lamps to each 4-ft. section.

John T. Fallon, electrical engineer of the D. & R. G. W., met some opposition in the planning stages of the installation from some who thought that an intensity of 35 footcandles would be sufficient. It is now generally conceded, however, that the small difference in cost between maintaining a 35- and 50-footcandle level is amply justified by the effectiveness of the lighting.

# New and Improved Products of the Manufacturers

#### Sanding Nozzle For Diesel Power

The latest sanding nozzle developed by Fairbanks, Morse & Co., 600 South Michigan avenue, Chicago 5, features ease of operation and a mechanism to minimize the spilling of sand during the

filling operation.

The valve opens automatically when the nozzle is lowered into the sand box through a ring on a sleeve which contacts the edge of the sandbox opening. The ring slides axially along two guides which tie the seat at the bottom of the nozzle to the top portion by the hose connection. When the sand box has been filled, the valve closes automatically by the weight of the sleeve. The sand seal is made with the bottom of the sleeve mating with a rubber seat fastened to a metal casting at the bottom of the guides.

The nozzle is constructed of steel tubing for long life. It is available in diameters of 2,  $2\frac{1}{2}$  and 3 in. All sizes have a length of 12 in. and weigh about  $7\frac{1}{2}$  lb.

#### Versatile Material Handling Truck

9

A 3,000-lb. capacity truck which can be used as a flat-bed burden carrier as well as for handling bulk materials is a new product of the Kalamazoo Manu-

The nozzle is in the closed position on the right, and in the open, or sanding, position on the left

facturing Company, Kalamazoo, Mich. The bulk-handling dump body is standard equipment on this truck and its capacity is 2/3 cu. yd., while the platform body is available as extra equipment.

The platform body is equipped with all-steel end and side gates, which are removable.

This unit is powered by a Wisconsin Model TF, 2-cylinder engine which can drive the truck at speeds up to 15 m.p.h., according to the manufacturer. A heavy duty transmission provides 3 speeds forward and one in reverse. Overall length,

width and height are respectively, 85½ in., 42 in. and 50¼ in. Ground clearance is 7½ in. while the wheel base is 56 in. and the turning radius of the body is 78½ in.

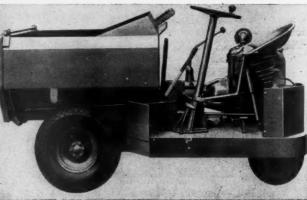

#### King Wheel-Slide Indicator And Control

The King wheel-slide indicator and control, recently developed by the Spring Packing Corporation, Chicago, is designed to prevent serious accidents and casualties caused by the power wheels on Diesel and electric locomotives sliding as a result of armatureshaft bearings freezing, pinion gears shearing, or any other condition which might cause the power wheels to slide. This device applies the train brakes when from any cause power wheels slip above a predetermined speed. It differs from other wheel-slide indicators and controls which reduce brake-cylinder pressure when wheels begin to slip or slide in brake applications.

The King equipment consists of (1) mechanically actuated control switch (normally closed), included in a housing fastened to the cover plate of the combination journal-bearing box and driven from the end of the axle by means of an A.A.R. spline fitting and spline-drive shaft; (2) a master switch, the same as described above but normally open, which may be driven from either a power wheel or an idler wheel;

Below—The Kal-Truk with dump body. Left—The platform body can take a 3,000 lb. load, and dumps to facilitate unloading if desired

(3) an indicator box which warns of wheel sliding and indicates the pair of wheels involved and the truck in which they are located; (4) a time delay and relay switch; (5) an air-operated solenoid valve; and (6) an air-brake applicator valve.

Parts 1 and 2 are located on the trucks of all locomotive units. Parts 3, 4, 5 and 6 are located inside the cab on A or head-end units only. The device operates independent of all other locomotive equipment except to apply the air brakes. Electrical energy is obtained directly from the storage battery, or in case of electric locomotives from a transformer. If a locomotive consists of more than one unit, then the circuits are made continuous by the use of jumpers between adjoining units, similar to those now used with electro-pneumatic brakes.

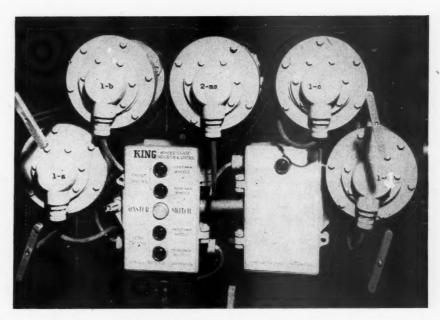

ce

in.

In operation, after the speed of the locomotive reaches a set point, the master switch is closed and electric energy is then available at the control switch on each pair of powered wheels. If all wheels are turning, then the control switches are open and this will be indicated by a green light, only, on the indicator panel. Should a pair of powered wheels start sliding from any cause, at or above the set speed, then in addition to the green light on the indicator panel a red light will show, indicating which pair of wheels is sliding and in which truck they are located. At the same time, an alarm will be sounded.

If the speed of the locomotive is not reduced below a set speed within a suitable time, the time delay and relay switch (4), being energized, will cause the air-operated solenoid valve (5) to function. When this valve is energized, it operates the air-brake applicator valve (6), which in turn automatically applies the locomotive and train brakes and will continue to apply them until the speed has been reduced below the predeter-mined speed adjustment of the master switch. The brakes may then be released, and the defective unit set out, or at least the main track cleared as long as the speed does not exceed the limiting speed adjustment of the master switch.

The brake applicator valve is a simple differential valve, applied in the main-reservoir supply line, between the main reservoir and the automatic brake valve, and in the brake pipe. In normal or operating position, main reservoir pressure simply passes through the body of the valve, through the feed valve and automatic brake valve, and back through the brake pipe. Whenever the brake applicator valve is operated as the result of a wheel-slide indication, main-reservoir pressure is admitted to the outer side of the large differential piston, by action of the air-operated solenoid valve; thereby balancing the pressure on each side of the large differential piston. The small differential pis-

Control switches on powered wheels are shown at 1-a, 1-b, 1-c, 1-d. The master switch 2-ms is on either a powered wheel or an idler wheel. These go on all locomotive units. The signal indicator boxes and all other control mechanisms go on A units only

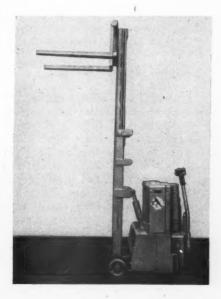

ton then moves the differential valve in the opposite direction, causing the slide valve of the differential valve to close the communication between the main reservoir and the automatic brake valve, and opening a service application valve in the brake-pipe chamber of the brake applicator valve. This vents brake-pipe pressure to the atmosphere through the service exhaust port of the brake-pipe chamber of the brake applicator valve and causes a full service application of the pneumatic brakes.

#### Low Capacity Jackstacker

Just announced by Lewis-Shepard Products, Inc., 265 Walnut st., Watertown 72, Mass., is a 1,000 lb. capacity "walkie" electric fork truck, maximum rated capacity being obtained when the load is no more than 48 in. in length. Models are available with or without telescoping masts, with fork elevations possible up to 130 in. The overall length of the unit, less forks, is only  $46\frac{1}{2}$  in. A new shaft mounting permits the forks to be hinged back over the truck quickly, so that it may be placed aboard small elevators or on trucks, for movement from one place to another.

The master drive unit of this fork truck, which includes traction motor, gear drive, contactor panel, and handle complete with all controls, can be replaced in a very short time, the manufacturer states.

Other advantages claimed for this unit by the builder are: an adjustable by-pass release valve insures that the truck will not pick up more than its rated load; it is impossible to reverse the motor while going in any given direction; electric brakes are applied merely by

releasing the handle triggers; sealed ball bearings and self-lubricating bushings throughout; any or all controls can be operated with handle in any position, since all controls are in the handle head; and the truck cannot be started in high speed.

#### SAWYER REPORT

(Continued from page 53)

which is concerned with the long-range maintenance of adequate transportation at non-discriminatory rates." A footnote says "it is recognized that there are occasional situations where rates which fail to cover all costs are justified but departures from cost standards should be permitted only upon a convincing show of necessity for the promotion of traffic or conservation of the carrier's revenues, not at the expense of competing carriers qualified to perform the service more economically, nor in cases where unjust discrimination would result." Later on the matter is put this way:

"The general position which this report advances is that if another type of carrier or another carrier of the same type can perform the service at a profit, it is entitled to the business and the carriers which are being protected should restrict themselves to operations in which they have a clear economic advantage. This general principle is set forth in the Transportation Act of 1940 as basic national transportation policy."

The report's suggestions that there might well be some relaxation of regulation of carriers other than railroads and pipe lines run particularly to the certificate and permit phases of regulation. This authority to "control entry into business" is called a "very real power," and a study is suggested to determine whether "substantial" benefits to the public have resulted. If not, the report adds, "there would be little justification for continuing restrictions which limit the opportunity of the American citizen to engage in business." It goes on to cite B.I.R. reports which complained of restrictions placed by the I.C.C. in motor carrier certificates; and it refers to recent commission decisions that "suggest an interpretation of the statute which would in effect whittle away the exemptions for carriers of agricultural commodities which were specifically provided by law."

#### Repeal Bulwinkle Act?

Meanwhile continued regulation of railroads and pipe lines on the present basis is found "justified in the public interest." In its brief comment on the regulation of activities of carrier rate conferences, the report suggests that consideration be given to repeal of the Bulwinkle-Reed Act (now section 5a of the Interstate Commerce Act), and of like provisions of the Merchant Marine and Civil Aeronautics acts—"unless effective and continued supervision of the conference is maintained by the regulatory agencies and unless more specific standards for prescribing rates are developed than at present." In the latter connection, the report had said previously that regulatory agencies should require that rates published as a result of carrier conferences "be reasonably related to a fully distributed cost standard"

The recommendation calling for compulsory consolidation of railroads is embodied in the report's discussion of the "promotion of carrier efficiency." It is bottomed on reports made on the subject by the former Federal Coordinator of Transportation and the B.I.R. A cited estimate by the latter is that "increased efficiency would save the railroads about \$1,400 million on an

annual basis." The recommendation is then set out as follows:

"The problem of consolidation is particularly urgent in the railroad field. . . . Every effort should be made through the promotion or the requirement of consolidations and unifications and through the elimination of unprofitable services to reduce the overall cost of railroad operations with a view to minimizing the rate burden which now falls upon the shipper of carload freight. Activities with the objective of obtaining the most efficient railroad plant should be initiated immediately. The carriers can undoubtedly do much in this direction on their own initiative but it is equally clear that they will need active support and direction from the federal government. This may involve a mixture of incentives and compulsory action. One incentive requiring immediate consideration is a more liberal policy with respect to abandonments. Further incentives should be explored."

#### Would Revise Mail Pay

With respect to the handling of mail, the report suggests a reconsideration of the method of paying the railroads for the transportation of so-called bulk or storage mail. The present arrangement under which the mail-pay rate applies for empty as well as loaded movements, as the report puts it, "appears to place a premium on inefficiency by making it profitable for the railroads to return empty space . . . even though other traffic consisting of baggage and express is available for movement." Another suggestion is that consideration be given to the enactment of legislation that would permit the Post Office Department to use motor common carriers for the handling of mail, i.e., legislation, in general terms, which would authorize "use of the cheapest means of transportation consistent with expeditious handling of the mail."

"A change in the law making additional means of transportation available to the department," the report continues, "would allow it to make effective use of a statute providing for negotiation with railroads to obtain rates lower than the maximum rates for carriage of mail prescribed by the Interstate Commerce Commission. Most freight of commercial shippers moves at rates lower than maximum."

The report's concluding section on "Federal Transportation Policies and National Defense" says it cannot be too strongly emphasized that an "adequate" supply of transportation is essential to the prosecution of any war. Considering what "adequacy" as applied to wartime transportation means, the report decides that it "refers to a situation in which the general plan of wartime operations, together with the maintenance of the remaining civilian activities which are essential, is not unduly disrupted or upset as a result of a shortage of transport facilities."

In other words, the report adds, "proper concept of the word 'adequacy' would appear to be one in which transportation does not serve as a brake upon the war effort and, conversely, one in which resources are not wasted in providing transport facilities at the expense of other basic materials and supplies which are needed." Here also is the suggestion that the agency doing all of the federal government's research and promotional work in the transport field could be converted readily into an agency for administration of wartime transport controls.

# "Indirect Approach" To Nationalization

## Gass explains danger of giving government more power

A. H. Gass, chairman of the Car Service Division of the Association of American Railroads, warned in an address on December 14 of what he termed the "indirect" approach to nationalization of railroads, which is based upon "suggestions that government would effect improvements that the carriers themselves cannot or will not bring about." Speaking on Transportation in National Emergencies, he told members of the Ohio Valley Shippers Advisory Board, meeting at Cincinnati, Ohio, that this "indirect" approach was used abroad. Illustrating his views, Mr. Gass re-

ferred to criticism that the railroads are "overbuilt"; that there is too much circuitous routing, causing an expensive and wasteful burden upon the economy; that there ought to be an end to crosshauling; and that there should be more and better planning of transportation facilities. "Expressed or implied in all of these statements," said Mr. Gass, "is the idea that if you will but give the necessary power to the government, all these things would be taken care of and handled as they ought to be handled. Let us concede that such statements have a plausible sound, especially to the uninformed. We who are close to transportation, however, know the fallacies inherent in them, and we ought not to be backward in sharing our knowledge."

#### What Constitutes "Overbuilding"?

The speaker said that, in the 1930's, there was much talk about "overbuilt railroads" and "over-investment in railroad facilities." "Then the war came, and rail traffic jumped from 290 billion ton-miles in 1938 to 737 billion ton-miles in 1944, nearly threefold. Revenue passenger-miles jumped meanwhile from 21.6 billion to 95.5 billion, more than fourfold. In the light of these figures, who is to say—in advance of the next emergency—what constitutes 'overbuilt' railroads?"

Commenting on circuitous routing, Mr. Gass said that "the result of this multiplicity of traffic arteries is that our rail transportation system would appear to be practically safe from prolonged interruption due to enemy action. Such action might block one or more important channels and preduce some temporary and local congestion and delay. How-

ever, it would be only a matter of hours—perhaps only minutes—before the dammed-up traffic would begin to flow around the interruption, through the numerous alternative and secondary channels."

Mr. Gass added that the shortest route in miles is not necessarily the most economical or most efficient route, or the route best suited to the shipper's individual requirements. He then posed the question, that if all traffic were to be restricted to the shortest routes, what would become of the alternative routes which give us the flexibility and adaptability and relative invulnerability which are among our sources of strength?

Continuing, the speaker said: "As to government planning of transportation, I would ask only one question. Should transportation facilities be located where the traffic is, or where some government stargazer thinks they ought to be located, perhaps for sociological or some other reasons? Of course, we make some mistakes sometimes in locating trackage, but the remedy for that is to pull up such tracks—when the shippers and the government will let us.

#### Solution Lies with Businessmen

"In transportation, as in most other matters, the individual in daily touch with the problems of the job knows a great deal more about how the job ought to be handled than some government man at a desk in Washington, dealing by directives with the problems of what he calls 'the field.' I shall continue to believe that the buyers and the operators of transportation can jointly solve transportation problems better than any select group of government planners. The British are now beginning to discover that truth."

The speaker asserted that the solution to one of today's foremost transportation problems-that of low railroad earnings-lies to a great extent in the hands of businessmen. Citing rising costs and the inequities of governmental fiscal policy and transportation regulation, Mr. Gass declared: "The first question is what are you going to do to put the transportation situation on a sound, enduring basis. The second question—perhaps of even greater importance—is when are you going to start doing it? No one has a greater stake in the safety of our nation, or in the soundness of our economy, than the businessman of America, or has better reason to appreciate how vitally transportation affects these interests. It is high time that he should be setting about to look to his stake in these matters."

#### "Caroling Commuters"

The country's first televised Caroling Commuters, and what is believed to be the first television program regularly scheduled from a railroad station, will be gired from the South Station, Boston, Mass., for five nights prior to Christmas, by the New York, New Haven & Hartford and the Boston & Albany (New York Central). The commuters' introduction to being video "stars" will be provided from 4:30 to 5 p.m. each evening, December 20-24, inclusive. Station WBZ-TV will move its cameras and technicians into the station concourse each evening and, in addition to group carols, individuals in the station throng will be offered an opportunity each night to do solo broadcasting.

#### State Commissioners' Support Bulwinkle Act

A statement supporting the Reed-Bulwinkle Act has been submitted by Walter R. McDonald, general solicitor of the National Association of Railroad and Utilities Commissioners, to the House Judiciary subcommittee on monopoly power. The subcommittee, headed by Representative Celler, Democrat of New York, is now in recess, but will continue its hearings after Congress reconvenes in January. During November and December the Celler group heard several witnesses on the Reed-Bulwinkle Act (section 5A of the Interstate Commerce Act) and Mr. McDonald's statement, filed on behalf of the N.A.R.U.C. membership, adds to the growing list of supporters of the statute.

Mr. McDonald said that members of state regulatory commissions, most of whom are also members of the N.A.R.-U.C., have a "direct interest" in the preservation of the provisions of the act, and are opposed to any legislation designed toward its repeal. The act provides anti-trust immunity to carriers entering into rate-making agreements with I.C.C. approval.

"To repeal Section 5A... would be tantamount to new legislation inasmuch as it would represent a radical departure from the traditional policy of the nation...," Mr. McDonald declared. The statement said also that "exemption from prosecution is not absolute" under the act, and that the conferences and bureaus permissable under Reed-Bulwinkle perform at least six "useful and necessary" services: Present a practical solu-

tion to the problem of maintaining the complicated rate structures; aid in prevention of unjust discrimination between persons or localities; contribute to the stability and uniformity of the rate structure; provide shippers with a common forum before which requests for rate changes may be presented to all carriers; simplify enforcement of the Interstate Commerce Act; and aid the member carriers in meeting the requirements of the government in time of national emergency.

#### Open Hearing on Rio Grande Plea to Open Ogden Gateway

The Interstate Commerce Commission, on December 12, began its hearing on the Denver & Rio Grande Western petition seeking to have the commission force the Union Pacific to open the Ogden, (Utah) gateway (see Railway Age of August 6, page 62). To accomplish this, the Rio Grande asks that the U.P. be made to participate in joint through rates via the gateway on traffic between so-called Colorado common points or points east thereof, and points in Idaho, Montana, Oregon, Washington and British Columbia. The proceeding is docketed as No. 30297 and is being heard by examiner Frank E. Mullen.

The hearing opened with testimony by Rio Grande witnesses, of whom there are reported to be more than 30. Direct evidence by the complaining road is expected to require a week or more, and will emphasize the Rio Grande's contention that the choice of routes is a matter for the shipper to decide. The road charges that it is contrary to the national transportation policy for the defendants (U.P., together with all parties to tariffs covering movements of the traffic involved) "to restrict the use of such vital through routes to emergency situations."

The U.P., on the other hand, maintains that the Rio Grande is attempting to invade a territory built up by the

U.P. through large expenditures of money. A. E. Stoddard, U.P. president, has asserted that inclusion of the Rio Grande in the routing would "result in longer, slower and circuitous routing, which entails expensive, unnecessary and wasteful transportation practices."

#### Permits Boost in Fares for Single-Occupancy of Rooms

Reversing its Division 2, the Interstate Commerce Commission has authorized increases in railroad fares which are applicable where there is singleoccupancy of Pullman compartments and drawing rooms in through service via Washington, D. C., to and from New York, New Haven & Hartford points, Boston, Mass., to New York, and Pennsylvania Railroad points, New York and south thereof, on the one hand, and, on the other, points on the Richmond, Fredericksburg & Potomac, Atlantic Coast Line, Seaboard Air Line, and Florida East Coast. The authorized increases will raise the railroad charge where there is single-occupancy of compartments from 1 1/10 to 11/2 adult fares, while the rate where there is single-occupancy of drawing rooms will go up from 11/2 to 2 adult fares.

The proceeding was I.&S. docket No. 5615, and the commission's report vacated the order under which the tariffs involved had been suspended for the past year. The report also embraced Fourth Section Application No. 23844 which tied into the rate-increase proposal, and the commission granted the relief there sought. It is relief from the aggregate-of-intermediates provision, required because the increases will produce through rates to and from points south of Hamlet, N. C., higher than combination rates to and from that point to which the Seaboard blankets back the competitive fares it maintains to and from Atlanta, Ga.

Commissioner Splawn filed a dissenting opinion in which Commissioners

Aitchison and Johnson joined. Messrs. Splawn and Aitchson comprised the Division 2 majority which made the prior report to which the division's third member, Commissioner Alldredge, dissented (see Railway Age of July 23, page 49). Commissioner Miller, "being necessarily absent," did not participate in the disposition of the case.

#### G. N. to Cut Fares 32 Per Cent Between Seattle and Vancouver

The Great Northern plans, on January 15, to reduce by 32 per cent its one-way and round-trip coach fares between Seattle, Wash., and Vancouver, B. C. N. D. Keller, general passenger agent at Seattle said the new fares will be the lowest of any common carrier between the two points and will apply at all stations on the Seattle-Vancouver line.

Present one-way and round-trip rail-road coach fares between the two cities, excluding federal tax, are \$4.26 and \$7.70, respectively. The fares are \$3.30 and \$5.95 by bus and \$7.95 and \$15.20 by air. The new G. N. fares will be \$2.90 one-way and \$5.25 round trip.

Mr. Keller said that, in preparing for the inauguration of streamliner service on the Seattle-Vancouver line next Spring, the railroad recently conducted a survey of the patronage potential in that territory. The substantial preference was for rail travel, largely because of the safety and comfort factors, he added. "The G. N. now proposes to combine those incentives with the lowest one-way and round-trip coach fares of any common carrier serving the Seattle-Vancouver route, and to make them effective in advance of streamliner service."

## Wyer Appointed to Head P.S.C. Investigation of Long Island

An investigation by the New York State Public Service Commission of the Long Island's commutation rates, basic fares, service, freight revenues and its relationship with the Pennsylvania was announced this week by Benjamin F. Feinberg, chairman of the commission. William Wyer, senior member of William Wyer & Co., consulting engineers, and former operating head of the Central of New Jersey, has been appointed to conduct the investigation.

#### Robertson Blasts Labor Act In Newspaper Interview

Declaring that the Railway Labor Act originally contemplated settlement of disputes by boards "with a sympathy and understanding for labor," David B. Robertson, president of the Brotherhood of Locomotive Firemen & Enginemen, is reported to have told a staff writer for the Scripps-Howard newspapers that the act "has broken down, largely as a result of the appointment to adjustment boards of lawyers, economists and professors who have received more and

WHAT IT. TAKES TO MOVE A SHOVEL.—A Lima-Hamilton Diesel switcher pulls cars loaded with components of a Lima-Hamilton Type 2400 shovel for delivery to a West Virginia contractor. The shovel has a capacity of 6 cu. yd., and will be used for stripping coal. It is powered by a Hamilton 6-cyl., 8¾ by 12 Diesel, developing 400 net hp. The locomotive Diesel is a Hamilton 8-cyl., 9 by 12 engine, pressure-charged, with 1,200 net hp. Both Diesel engines are built at Lima-Hamilton's Hamilton, Ohio, plant, and the shovel and locomotive at its Lima, Ohio, plant

more cases that could be settled on a local level."

While admitting that "railroad labor has made gains in recent years," Mr. Robertson was quoted as having said that these had been won "at unnecessary cost to the unions." "Emergency boards," he added, "have returned such unsatisfactory recommendations in recent years" that his brotherhood "has been forced to reject nearly all and fight for added improvements." He was also reported, however, to have said that "the unions have been forced to accept inadequate rewards with which they completely disagree" because of "threats of federal seizure of railroads."

#### **Barriger on College Staff**

John W. Barriger, president of the Chicago, Indianapolis & Louisville, has been appointed a faculty associate of Indiana University's department of transportation. He is one of seven Midwestern business leaders appointed to act as consultants in the development of study and research programs in accordance with changing business conditions and demands. The Monon president will also visit the campus for consultation with students specializing in the study of transportation to assist them on projects and in planning careers.

## Truckers Consider "Retaliatory Campaign"

Fifty-three executives of major truck lines, all members of the American Trucking Associations' public relations committee, met recently in Chicago to plan "immediate and substantial expansion of the work of telling the story of the trucking industry to the general public and to such special publics as are concerned." Definite provision of support for this expansion was agreed upon early in the meeting, and plans made for further meetings, the A.T.A. announced.

Among proposals considered to combat what was described as an "anti-truck drive" were the advisability of a "retaliatory campaign against the rail-roads," the interest of the shipper in this attack not only as a buyer of for-hire truck transport but as an operator of large numbers of motor trucks hauling his own goods; copy base for industry advertising; utilization of truck sides for promotional purposes; and co-operation with employees in disseminating the "truth" about truck transportation.

#### Johnson I.C.C. Chairman For 1950; Succeeds Mahaffie

Interstate Commerce Commissioner J. Monroe Johnson has been chosen by the commission as its chairman for the year 1950. He will succeed Commissioner Charles D. Mahaffie, who will continue as a member of the commission.

Commissioner Johnson has been a member of the I.C.C. since June, 1940; and for five years prior to that time served as Assistant Secretary of Commerce. He was in line for the chairmanship in prior years, but due to his appointment as Director of the Office of Defense Transportation in 1944 was not available to serve. He continued as a member of the commission while with O.D.T., but participated in decisions only where there was an equal division of the commission's membership.

#### Air Lines Object to Railroad Criticism

Robert Ramspeck, executive vicepresident of the Air Transport Association of America, struck back at railroad criticism of air line competition in a talk before the Chicago Rotary Club on December 13. "The railroads have no reason for complaint against the air lines," Mr. Ramspeck said. "If they are in difficulty it is not the result of air line competition. In 1948 air lines performed only 1.6 per cent of the total passenger transportation, and only one-half of one per cent of the total freight transportation of the nation."

The speaker said that most of the criticism of air line subsidy is "eye wash . . . . We could toss figures back at figures for months. . . . We will put our record of public aid up against that received by any other form of transportation providing all will tell all, that any form of public aid is still public aid."

He then outlined details of the comprehensive industry-government-military program for improving safety, dependability and regularity of scheduled air line performance, and predicted that the scheduled domestic air lines would fly approximately 6,500,000,000 passengermiles this year and carry 41 per cent of the total first-class travel market. He also pointed out that recent rail passenger fare increases bring air fares below rail fares in many instances.

## Unschooled Crew Ran By Meet Point, Causing Collision

Reporting on a September 3 collision between freight trains of the Chicago, Rock Island & Pacific and the Chicago, Burlington & Quincy, the Interstate Commerce Commission has reviewed evidence indicating that members of the Rock Island crew were unfamiliar with the Burlington line over which they were running. The evidence was to the effect that no member of the Rock Island crew had been examined regarding applicable Burlington operating rules, or made acquainted with the physical characteristics of the line; and that the Rock Island conductor had been "instructed to proceed" when he "protested" against making the trip, his initial run over the line, without a pilot. The report also said that the Rock Island engineer and fireman had made

SIXTY YEARS AN I. C. COMMUTER—AND STILL AT IT.—The Illinois Central, represented by its president, Wayne A. Johnston (right), took ocassion on December 1 to honor a "perennial" commuter whose journeys between his home and work during the past 60 years are equivalent in distance to 13 times around the world. He is L. Scott Tiffany, 82, who is shown being presented the No. 1 certificate of membership in the railroad's newly formed Half-Century Commuters Club. Also on hand for the ceremonies was old "tea-kettle" engine No. 201, which powered commuter trains when Mr. Tiffany first began using I. C. service in 1889. He recalls the days when I. C. trains reached Randolph Street station on a trestle in the bed of Lake Michigan and that "on windy days we would close the windows to keep out the lake spray." Mr. Tiffany continues active as board chairman of a rug and furniture firm located in Chicago's "Loop"

#### THE RAILROADER'S PURSUIT OF HAPPINESS

Declaration of Independence specifies three God-given rights-life, liberty and the pursuit of happiness. The Declaration of Independence does not identify happiness as one of the rights. It clearly referred to the pursuit of happiness as the right of all men. That is your guarantee and my guarantee. We have not been promised happiness. We have been given the right to work for it, the right to pursue it and grasp it and the right to fight for it, if fighting be necessary.

"But we now find many who believe that happiness is something their federal government should give to them in one form or another. There are those . . . who expect their undertakings to succeed, not because they are able to develop the happiness of success by legitimate pursuit, but because they look to government for subsidies to absorb costs they are unable to

"Your railways have asked for no governmental assistance and ask for none now. They received no part of the near billion dollars in federal aid given to transportation in 1948 and probably more than that in 1949. They have asked only for the fair treatment to which they are entitled and which they have so deservedly earned throughout the years and particularly during the late war. And in their request for such fair treatment they have included the relaxation of unnecessary regulation, a halt to the imposition of added and equally unnecessary regulation and the combining of governmentally assumed responsibilies for costs with those controlling revenues. They have repeatedly cautioned against the imposition of costs and taxes without regard to their ability to pay, costs which would ultimately price them out of the transportation market. They have asked that railway management be permitted to manage. But in these pleadings for fair treatment, the railways find themselves very near to being alone. The interests of business and industry as a whole have failed to support the very agency that has made their success possible. Blindly and selfishly they follow the lure of today without opening their eyes to the dangers of the morrow. They refuse to concede that their future welfare is tied to that of the railways now, just as it has been in the

"What of the future? Can the railways

continue to develop? Can they continue to give our country the highly efficient service that they have provided through more than a century of effort? They have been outstanding leaders in the pursuit of happiness. The railway industry has carried with it all other basic industries in their successful realization of the opportunities afforded by our freedom. Is it soon to be deprived of the rights of private enterprise? Shall the railway industry be denied the right to attract new capital because its costs of operation and maintenance are increased to the point where it cannot longer earn even the semblance of a fair return upon its investment? Is it to be denied the right to pursue happiness by being subjected to taxation for the support of its competitors, the highways, the waterways and the airways? When it can no longer lead in the growth and development of our country it will be for the reason that the Constitutional guarantees of individualism, of opportunity and of freedom have been displaced by a shackled regimentation under a socialistic order. The American people do not want a socialized railway industry, but thus far have failed to recognize the devious and sinister activities designed to force such a condition.

'We need but to look at Britain's experience to understand what state control of railways may mean. In 1948, British railways had 18 employees for every mile of main track, compared with six in the United States. There freight train-miles per train-hour averaged less than eight as against 16 on American railways. Britain's average train load was 162 tons, while ours was 1,176 tons. These are but a few comparisons that might be made. They all spell higher costs, which the people as a whole must pay. And Britain's railways paid no taxes in 1948 while American railways paid considerably over \$1 billion toward the cost of American government. On top of the loss of all railroad taxes, British austerity required its public to pay a 1948 railway deficit from operations of nearly \$19 million.

"The American public must be told in understandable terms what the nationalization of our railways may mean and they can rest assured that, just as our railways lead in pioneering and in preparing the way for other industry, just so would they lead on the downward path of socialism. They would be followed quickly by the entire transportation industry, by steel, coal, power, banks, by the automotive industry, the textile industry, the petroleum industry and many others. The American people do not want the evils of socialism, but they are doing too little to successfully combat its threat. . .

"As individuals, what can you do? You can talk, not occasionally, but frequently, not mildly or apologetically but forcefully. You can talk to the members of your family, your fellow railroaders, your friends and neighbors. . . . Talk in the interest of our industry, tell the businessmen, the shippers and the manufacturers along your lines the full truth and outline the consequences to them if that truth is not heeded. In the final analysis, it is within the power of business and industry to choose between private enterprise and a socialistic state. Ask them to give voice to their choice and not mumble. All this must be done at the same time that you carefully consider your operations and practices and correct or remove any weaknesses or shortcomings that may be present. Then act as you talk and encourage others to act likewise. Do not be discouraged should you be labeled a prophet of ruin. . Those who might so accuse you are those who would have you fail in your duty to our industry. They are the fellow-travelers of socialism.

"You have been very busy looking after the many responsibilities attached to your respective jobs and may have overlooked your even greater responsibility, the responsibility of preserving the Constitution and our American way of life. If you have, do not neglect it longer. Be you a Democrat or a Republican, be first an American who will fight for Americanism and will fight against socialism in all its forms and particularly in the form of centralization of control and power, who will fight for his republic and keep it. The American railroader has every reason to jealously guard his three rights, and not the least of these is the 'pursuit of happiness.' May he also guard those rights aggressively."

From an address to the New England Railroad Club on December 13 by F. S. Schwinn, assistant chief engineer, Missouri Pacific Lines; president, American Railway Engineering Association, and chairman, En-

gineering division, A.A.R.

only one previous trip over the line, the engineer having "protested" in vain against making that trip without a pi-

The Rock Island train ran by the point where it was supposed to have met the Burlington train, so the formal finding of the commission's report, which was by Commissioner Patterson, was that the accident, a head-end collision, was caused by "failure to obey a meet order." The accident resulted in the death of the Burlington train's engineer and the injury of three other members of its crew. The commission followed up its finding as to the cause with a recommendation that the Burlington install an "adequate" block system on the line involved.

The line is a single-track section of the Galesburg division, from Colona, Ill., to Orion, 10.3 mi., over which trains are operated by timetable and train orders, and by a manual-block system for following movements only. The commission had the latter in mind in recommending that an "adequate" block system be installed. "The book of operating rules of the C.B.&Q." it said, "contains manual-block rules for the blocking of opposing trains as well as following trains, but the provision for blocking opposing trains was not in effect in the territory in question. If this provision had been in effect in this territory these opposing trains would not have been permitted to occupy the same block simultaneously."

The collision occurred 2.29 mi. south

of Briar Bluff, Ill., the point at which the Rock Island train was supposed to have waited to meet the Burlington train. Briar Bluff is 1.6 mi. south of Colona, the northern point on the Burlington line over which Rock Island trains are operated by their own crews. The southbound Rock Island train was Extra R.I.2593 South-locomotive, 31 cars and caboose; the northbound Burlington train was Extra 4971 Northlocomotive, 25 cars and caboose. Members of both crews received and understood a Burlington train order which established Briar Bluff as the meeting point, and provided that the Burlington train would take a siding there while the Rock Island train remained on the main track north of the fouling point at the south siding-switch.

The order was delivered to the R. I. crew when its train entered upon the Burlington line at Colona. The engineer told the commission investigators that he read the order and handed it to the front brakeman, who, the report continued, "was consulting the timetable to determine the location of Briar Bluff when the engineer observed the opposing train." The engineer placed the brake valve in emergency position and the train had "almost stopped" when

the collision occurred.

#### **Additional Testimony**

Meanwhile, the conductor said that when he read the train order, both he and the flagman "consulted the timetable to determine the location of Briar Bluff." His further testimony on this point was summarized by the cemmission as follows: "When it was discovered that Briar Bluff was the first station south of Colona, the flagman informed the conductor that they had just passed a siding. The conductor then took action to open the conductor's valve. . .but the brakes were applied in emergency before

he reached the valve."

The Rock Island fireman had not read the train order, although one of the applicable rules, as quoted by the commission, stipulated that "enginemen must show train orders to firemen," while showing them to "forward trainmen" is required only "when practicable." The main station sign at Briar Bluff is on the fireman's side, but there is an advance station sign on the engineer's side, 1.11 mi. north of the station. The engineer said he did not see either of these signs; he saw the siding, but did not recognize it as the meeting point, because he "thought that Briar Bluff was the second station south of Colona instead of the first."

The surviving members of the Burlington engine crew said they saw the Rock Island train about 650 ft. ahead of them, and warned their engineer who applied the brakes in emergency. They estimated that the speed of their train had been reduced to about 20 m.p.h. when the collision occurred. Both locomotives were derailed along with the second to sixth cars, inclusive, of the

R. I. train, and the first five cars of the Burlington train. The front end of the Burlington locomotive was described in the report as having been "crushed and forced upward," while its cab "was crushed and the cistern torn loose from the tender frame." The weather was "clear" at the time of the accident-11:44 a.m.

#### Pooled Crews

The commission's investigation disclosed that prior to August 16, a Rock Island crew was regularly assigned to the movement involved. On that date, crew assignments were changed to pool service, and thereafter the R. I. crew with the greatest amount of time off duty at the originating terminal was assigned to the run.

thus Employees assigned "required" by the C.B.&Q. to pass an examination on its operating rules, and to be "fully acquainted" with the physical characteristics of the line, the commission said. It added that a pilot is required if the R. I. employees are not so qualified. And it explained further that arrangements had been made whereby examinations of R. I. employees were to have been conducted by a representative of that road who had previously been examined by the Burlington.

"The engineer of Extra R.I.2593 South," the report continued, "reported for examination on August 29, 1949, when he was about to start his first trip over this line. He said that he was not examined but was issued a certificate bearing the endorsement of the official assigned to examine him and indicating that he had been examined. Before beginning his first trip over the C.B.&Q. line, the conductor reported to the designated C.R.I.&P. official for examination at 9:45 a.m. on the day of the accident. He said that the C.R.I.&P. officer discussed [one rule], informed him that the other rules either were identical or similar to the C.R.I.&P. rules, and issued a certificate that the conductor was qualified to operate trains between Colona and Orion Junction.

"The fireman reported for examination but was informed that it was not necessary that firemen be examined. The front brakeman and the flagman said that they had not been examined. The engineer and the fireman had made only one trip over the C.B.&Q. between Colona and Orion Junction. This trip was made five days prior to the day of

the accident."

Then came the references to the protests made by the engineer and conductor against making their initial trips without a pilot, the report proceeding to note that neither the front brakeman nor flagman had made a trip over the line prior to the day of the accident; and that copies of the current Burlington timetable "were provided only for the engineer and for the conductor." It added that "if a pilot had been assigned to this train, the accident probably would not have occurred.

#### Freight Car Loadings

Loadings of revenue freight in the week ended December 10 totaled 668,-825 cars, the Association of American Railroads announced on December 15. This was a decrease of 25,098 cars, or 3.6 per cent, below the previous week, a drop of 114,088 cars, or 14.6 per cent, under the corresponding week last year and a decline of 185,334 cars, or 21.7 per cent, below the equivalent 1947 week. Coal loadings last week numbered 136,017 cars, 3,426 cars less than in the previous week and 29,214 cars below the comparable 1948 week.

Loadings of revenue freight for the week ended December 3 totaled 693,923 cars, and the summary for that week as compiled by the Car Service Division,

A.A.R., follows:

48 weeks

REVENUE For the week	FREIGHT ( ended Sat 1949	urday, Dece	NGS mber 3 1947

#### U. S. Chamber Plans **Transport Conference**

A two-day National Transportation Conference, sponsored by the United States Chamber of Commerce and bringing together representatives of carriers, shippers, investors, and the public, will be held in Washington, D. C., on February 1-2.

Approximately 100 persons are expected to participate in the conference which will be devoted to round-table discussions on major issues confronting

the transportation industry. Plans for the two-day session are being made by the chamber's Transportation and Communication Department.

With various transportation authorities serving as moderators, the discussions will cover government transportation administration, the effect of government aids on allocation of traffic, and the relation of government aids to national security.

## Establish Award for Defense Transport Ideas

A national transportation award to be presented annually for the year's most outstanding contribution to defense transportation has been established by the National Defense Transportation Association "to encourage programs of transportation research and development, particularly among private, industrial, educational and research organizations in cooperation with the research agencies of the Department of Defense.' Any individual, firm, society, association or similar organization The winner will be selected by a board of impartial judges including flag and general officers from all branches of the Defense department. Judging will be on the basis of transportation value and defense or military application. Deadline for entries, properly documented, will be April 1, 1950, with the 1949 award scheduled to be presented next

#### Conductors and Trainmen End 40-Hr. Week Negotiations

Representatives of the Brotherhood of Railroad Trainmen and the Order of Railway Conductors broke off negotiations with the Carriers' Conference Committees at Chicago on December 14 without reaching agreement on their demand for a 40-hr. week for yard service employees, and a number of rules changes. The organizations began circulation of a strike ballot on December 15, with a reported date of January 24, 1950, for return of the ballot. The organizations served the demands on the individual roads on March 15. Negotiations with the carriers had been in progress since September 22 (see Railway Age of October 1, page 55).

#### Grout, Soo Line Head, to Retire; MacNamara, C.P., Is Successor

H. P. Grout, president of the Minneapolis, St. Paul & Sault Ste. Marie since 1944, will retire on December 31 and will be succeeded by G. Allan MacNamara, vice-president—traffic, of the Canadian Pacific. Mr. Grout will continue as a director and member of the executive committee. Prior to January 1, 1948, Mr. MacNamara was general traffic manager of the Soo Line.

Additional General News appears on pages 88 and 89.

#### **OVERSEAS**

#### British Railways Form Special "Training Council"

To promote cooperation with unions in development of training and educational arrangements for railway employees, there has been organized in Great Britain, at the invitation of the Railway Executive, a British Railways Joint Training and Education Advisory Council, composed of representatives of the Railway Executive and of unions representing the various classes of employees.

The council will consider special training schemes for higher administrative posts, vocational training, promotional training, engineering and trade apprentices' training, training for supervisors, use of residential schools, and other matters relating to training and education of railway staff, and will make recommendations to the Railway Executive, to the end that "the fullest opportunity should be given to all sections of the staff and there will be the widest measure of co-operation with educational authorities."

Austria.—This country has released 350 million schillings (\$2.4 million) in Marshall Plan counterpart funds to be used in part to finance the nation's railroad reconstruction. Approximately 150 million schillings are earmarked for the railroads, and will be used to purchase 200 freight cars, reconstruct 500 wardamaged freight cars, and construct 80 miles of new roadway. Counterpart funds represent the income of participating Marshall Plan countries from the sale of E.C.A. goods within each country. The governments deposit the money in special accounts for industrial, agricultural or other recovery projects and release the funds periodically with E.C.A. agreement.

\$5,700,000 will help to bring about what has been termed "one of the most important works which Belgium has undertaken during the twentieth century"—the linking of its northern and southern railway networks in the heart of Brussels.

Interrupted by two world wars, the construction of an underground connection is now reported to be headed for completion by 1952, with partial service to begin in 1950 or 1951. The new link, according to the Economic Cooperation Administration, will permit freight cars loaded at Antwerp on the north to pass through the city with a minimum of delay, and will also speed up movement to northern seaports of cars loaded with export products of the country's heavily industrialized south. Belgium is also using Marshall Plan funds, the E. C. A. says, for elimination of important railroad-highway grade crossings.

#### **ORGANIZATIONS**

tr C h

li E

lo

ye 50 th th

The Chicago Passenger Club, at its annual election dinner on December 7, elected Glenn W. Hyett, city passenger agent of the Chicago, Milwaukee, St. Paul & Pacific, as its president for the coming year. Other officers elected are: First vice-president, E. S. Lambert, assistant city ticket agent, Chicago, Rock Island & Pacific; second vice-president, G. S. Pitts, ticket seller, New York Central, and secretary-treasurer, J. H. Otten, chief clerk, Northern Pacific.

# EQUIPMENT AND SUPPLIES

#### FREIGHT CARS

#### Burlington to Spend \$11 Million Building Cars in Own Shops

H. C. Murphy, president of the Burlington Lines, has announced that the road during 1950 will build \$11 million worth of cars in its shops. The equipment will include 1,400 steel-sheathed box cars, 800 all-steel hopper cars and 30 baggage-express cars.

The Merchants Despatch Transportation Corporation has ordered 500 40-ft. refrigerator cars from its own shops.

The Wabash has ordered 400 50-ton hopper cars from its own shops.

#### LOCOMOTIVES

The Atlantic Coast Line has ordered 73 Diesel-electric locomotive units from the Electro-Motive Division of General Motors Corporation at a cost of more than \$10,000,000. The order consists of 5 2,250-hp. passenger units, 36 1,500-hp. freight units, 9 1,200-hp. switching units and 23 1,500-hp. road-switching units. Delivery is scheduled to begin in January and to be completed in May. When the new motive power is received a large number of old steam locomotives will be sold or scrapped.

The Lehigh Valley has ordered nine Diesel-electric locomotive units. Five 1,000-hp. switching units will be built by the Baldwin Locomotive Works, one 1,200-hp. switching unit by the Electro-Motive Division of General Motors Corporation and three 1,500-hp. road-switching units by the American Locomotive Company.

The St. Louis-San Francisco has ordered 14 2,250-hp. Diesel-electric passenger locomotive units from the Elec-

tro-Motive Division of General Motors Corporation for delivery during the first half of 1950.

The Western Maryland has ordered 20 Diesel-electric locomotive units for delivery next February and March. The Electro-Motive Division of General Motors Corporation will build 12 1,500-hp. freight and 4 1,500-hp. road-switching units and the American Locomotive Company 4 1,500-hp. road-switching units.

#### SIGNALING

The Norfolk & Western has placed an order with the Union Switch & Signal Co. for necessary material to install 6.5 mi. of centralized traffic control between Petersburg, Va., and Jack, and replace the present mechanical interlocking at Jack with an electro-pneumatic interlocking. Control of the new installation will be in the dispatcher's office at Crewe. At the same time, the control of previously installed C.T.C. between Jack and Poe, and City Point Junction and Poe, and an interlocking at Poe, will be moved to Crewe. The construction work will be done by railroad forces.

#### SUPPLY TRADE

## American Steel Foundries Net Income Was \$6,505,442

Net income of American Steel Foundries and subsidiaries for the fiscal year ended September 30, 1949, was \$6,505,442, compared with \$6,008,851 for the preceding fiscal year, according to the recently released annual report. Sales during the fiscal year just ended totaled \$74,619,329, compared with \$76,982,944. The major portion were equipment parts furnished directly to railroads or to builders of freight and passenger cars and locomotives. Unfilled orders on September 30, 1949, totaled \$10,000,000, compared with \$36,000,000 a year earlier, reflecting, the report said, the "almost complete curtailment in purchase of new freight car equipment."

#### A.C.F. Backlog \$61,000,000 On October 31—Hardy

The backlog of the American Car & Foundry Co. and subsidiaries on October 31 was \$61,000,000, Charles J. Hardy, chairman, said in the recently published semiannual report to stockholders. Net earnings for the six months ended October 31 totaled \$2,267,826. Mr. Hardy's report said there are evidences of a resumption of railroad equipment buying.

Herbert W. Chamberlain, vice-president of the General Railway Signal Company, at Rochester, N. Y., has been appointed executive vice-president, with the same headquarters, effective January 1, 1950. Arthur E. Heimbach, western manager at Chicago, has been appointed vice-president at Rochester, and will be in charge of sales in the western United States and Canada. Appointed vice-president in charge of sales in the eastern United States and Canada is Percy W. Smith, eastern manager, with headquarters at New York. Oscar S. Field, director of engineering and research, with headquarters at Rochester, has been advanced to vice-president of engineering. Carl D. A. Henze, resident manager of the Chicago office, has been appointed western manager, with the same headquarters, and is succeeded by Eugene F. Auth, sales engineer of the Chicago office. Sydney W. Freeman, sales engineer of the New York office, has been appointed resident manager of the same office.

Mr. Chamberlin was born on January 25, 1890, in Rochester, and educated in the Rochester public schools and the Rochester Institute of Technology. He started his business career by entering the employ of the General Railway Signal Company upon its organization in 1904, and served in factory, production and financial departments until 1913, when he was appointed auditor and as-

Herbert W. Chamberlain

sistant treasurer of the General Railway Signal Company of Canada at Montreal, Que. In 1918 Mr. Chamberlain became vice-president of the latter company, and succeeded to its presidency two years later. From 1922 to 1924, he served as president of the Cyclemotor Corporation, and for the next three years as vice-president of the Cyclemotor Corporation, and for the next three years as vice-president of the G. R. S. Products Corporation at Albany, N. Y. Mr. Chamberlain was appointed assistant treasurer of the General Railway Signal Company in 1927, and elected secretary in 1933. He became assistant to the president in 1937, and in January, 1945, was appointed sales vice-president, which position he held until his recent appointment.

Born on December 23, 1902, in Allentown, Pa., Mr. Heimbach graduated in electrical engineering from Pennsylvania

State College in 1924. Susequently, he completed the two-year apprenticeship course of the Union Switch & Signal Co., and then served as engineer for that company until 1927, when he became train control supervisor of the Pittsburgh & Lake Erie. In 1931 he was appointed

Arthur E. Heimbach

assistant signal engineer, becoming assistant signal and telegraph engineer in 1933. He was promoted to principal assistant engineer in 1937, and in 1941 became associated with the General Railway Signal Company in Chicago as sales engineer. He was appointed resident manager of the Chicago office in 1945, and western manager in 1948.

A native of Springville, N. Y., where he was born on February 2, 1900, Mr. Smith attended grade and high schools at Salamanca, N. Y., and later studied at the Rochester Institute of Technology. During school vacations he worked as labor foreman for the Westinghouse-Church-Kerr Company, and also for the Buffalo, Rochester & Pittsburgh (now Baltimore & Ohio) as a part-time em-

Percy W. Smith

ployee, dividing his time between school and the railroad. In 1921 he began his full-time railroad experience as draftsman with the American Locomotive Company, joining the B. R. & P. as draftsman in the mechanical engineer's office in 1922. In 1923 he resigned from

that position to become a draftsman, and later an engineer, in the engineering department of the General Railway Signal Company. Mr. Smith was appointed sales engineer of the New York office in 1937, and advanced to resident manager in 1945, becoming eastern manager in 1948.

Mr. Field was born on March 9, 1892, in London, England. He received his early academic education in London at the St. Clement Danes Holborn Estate School, graduating in 1907. In 1912 he graduated from Regents Polytechnic of London in civil engineering, and in the same year came to the United States and entered the employ of the Brown Construction Company, Philadelphia, Pa., as assistant designer. He later served in the same position with the Baldwin Locomotive Company in Philadelphia, and in 1914 became associated with the Hall Signal Company of Gar-

Oscar S. Field

wood, N. J., as assistant to consulting engineer. He was promoted to patent attorney in 1916, and to chief engineer in 1919. Mr. Field graduated from the New Jersey Law School in 1922 and was admitted to the New Jersey bar and Supreme Court in 1923. In 1925 he moved to Albany, N. Y., where he became chief engineer of the G. R. S. Products Company. Appointed senior designing engineer of the General Railway Signal Company at Rochester in 1928, Mr. Field was advanced to director of engineering and research in January, 1945.

The newly appointed western manager, Mr. Henze, was born on February 1886, in Albany, where he attended the public schools. After graduation he studied mechanical engineering with the Illinois Correspondence School, starting his business career in 1901 as a draftsman with the Standard Signal Company at Green Island, N. Y. In 1903 he became a draftsman and estimator with the Pneumatic Signal Company at Rochester, and the following year, when the Taylor and Pneumatic Signal Companies formed the General Railway Signal Company, he was engaged in estimating, commercial engineering, and construction work. Mr. Henze joined the Federal

Signal Company as office engineer and construction foreman at Chicago in 1906, being transferred to Albany in 1909 as superintendent of construction. In 1911 he became resident manager at Chicago

Carl D. A. Henze

and, with the merger of the Federal Signal Company with the General Railway Signal Company in 1924, was appointed assistant resident manager at Chicago. He was advanced to resident manager in 1948.

Mr. Auth was born on November 4, 1907, at Clarksdale, Ill. After finishing high school, he took an electrical engineering course at Milliken University, Decatur, Ill. He entered railroad service in 1923 with the Wabash as a laborer at Decatur, and subsequently served as a signal helper until 1927, at which time he joined the Pennsylvania as a signalman on the St. Louis division. Mr. Auth also worked for the Chicago, Burlington & Quincy as a signalman, re-

Eugene F. Auth

turning to the P.R.R. in 1930 in the same position. From 1934 to 1936 he served as special apprentice and was later appointed assistant foreman telegraph and signals, New York division, becoming foreman, electric traction, of that division in 1938. The next year he was made inspector, telegraph and signals, New York division, and later that year was appointed supervisor, telegraph

and signals, of the Long Island, at Jamaica, N. Y. Following service as supervisor, telegraph and signals, Logansport division, of the Pennsylvania from 1940 to 1944, Mr. Auth became assistant trainmaster on the Grand Rapids division, and in December, 1944, went with the Railroad Accessories Corporation, at New York. In October, 1945, he was assigned to their western territory out of Chicago. He left the R.A.C. in 1947 to join the sales force of the Chicago office of General Railway Signal.

Mr. Freeman was born on May 27, 1907, in New York, and was graduated from the Rochester Institute of Technology in 1928, and from New York University in 1935 with a B. S. degree in electrical engineering. His career with General Railway Signal began in 1925 as a co-operative electrical student at Rochester, where he worked in various departments in the factory and offices. From 1928 to 1932, he was engaged in signaling installation work for the company, and subsequently took a job as signal maintenance foreman on the New

Sydney W. Freeman

York City subway system. In 1935 he went to Rio de Janeiro, Brazil, to work on railway signaling installation for General Railway Signal Company, returning to the company's home office in the United States in 1939. After spending a year on car retarder installation work, Mr. Freeman was made sales engineer of the New York office. During World War II he was engaged in testing and servicing remotely controlled machine gun turret systems installed on the B-29 "Superfortresses." He returned to sales work in 1944, in which capacity he remained until his appointment as resident manager.

The Kellogg Switchboard & Supply Co., Chicago, has appointed as assistant sales manager T. DeWitt Talmage, who was associated for 16 years with the Tennessee Valley Authority in various communications posts.

Neele E. Stearns, acting vice-president of the Inland Steel, Products Company (subsidiary of Inland Steel Company), has been elected executive vice-president of the subsidiary, with headquarters at Milwaukee, Wis. Mr. Stearns was formerly assistant general sales manager of the parent company.

J. Robert Bunch has been appointed sales representative to assist J. D. Alexander in the Cleveland (Ohio) sales office of the American Wheelabrator & Equipment Corp., Mishawaka, Ind. For the past four years, Mr. Bunch has supervised the erection and servicing of Wheelabrator blast cleaning equipment and Dustube collectors in the Cleveland area.

The Cherry Rivet Company, Los Angeles, Cal., has established a new branch sales office and warehouse at 69 Harney road, Scarsdale, N. Y.

Robert C. Hood, formerly vice-president of the Ansul Chemical Company, Marinette, Wis., has been elected president, succeeding his late brother, F. James Hood, whose death was reported in the Railway Age of December 3. Leonard C. McKesson, formerly sales director, has been advanced to vice-president in charge of sales, and Arthur C. Pope, formerly production manager of the company's sulfur dioxide and methyl chloride plants, has been promoted to vice-president in charge of manufacturing.

S. W. Rolph, executive vice-president of the Electric Storage Battery Company, Philadelphia, Pa., has been elected

S. W. Rolph

president, effective January 1, 1950, to succeed R. C. Norberg, who has been elected chairman of the board of directors.

John S. Vreeland, sales representative for the railway publications of the Simmons-Boardman Publishing Corporation, has been appointed business manager of one of those publications. Railway Signaling and Communications.

Mr. Vreeland was born at Cincinnati, Iowa, on November 16, 1907, and was graduated in engineering from Iowa State College, Ames, Iowa, in 1928. He worked two summers before graduation in the

engineering department of the Chicago, Rock Island & Pacific and after graduation joined that road as a rodman. He later was promoted to instrumentman and served in the engineering department at various points in Iowa, Minnesota and Missouri. He also worked on new line location and construction in Missouri and as an inspector, checking joint facility accounts. In June, 1931, he was appointed supervisor of track and worked in that capacity at various points in Arkansas, Okla-

John S. Vreeland

homa, Iowa and Missouri. Mr. Vreeland joined the Simmons-Boardman Publishing Corporation as associate editor of Railway Age and of Railway Engineering and Maintenance at Chicago, in April, 1938, and was advanced to eastern engineering editor of Railway Age and eastern editor of Railway Engineering and Maintenance in September, 1944. He was appointed sales representative for the company's railway publications in June, 1946.

#### OBITUARY

Maurice Costello, sales engineer for the Flannery Bolt Company, Bridgeville, Pa., died on November 29. He had been associated with Flannery Bolt continuously since 1913.

Harrison Hoblitzelle, chairman of the board of directors of the General Steel Castings Corporation, died on December 5, at his home in Ithan, Pa. Mr. Hoblitzelle was born in St. Louis, Mo., on October 17, 1896. He was graduated from Cornell University in 1917 and in November of that year joined the Commonwealth Steel Company, Granite City. Ill., working successively as assistant purchasing agent, assistant treasurer, manager of purchases and supplies, and as vice-president and manager of sales. When General Steel Castings purchased Commonwealth Steel in 1929, Mr. Hoblitzelle was elected a director of the corporation and vice-president and general manager of the Commonwealth Division. Early in 1931 he was elected executive vice-president, with headquarters at Eddystone, Pa., and in September of that year was elected president of the corporation. Due to ill health, he

Harrison Hoblitzelle

resigned the presidency on June 22, 1945, at which time he was elected chairman of the board of directors.

#### CONSTRUCTION

Union Pucific.-Company forces of this road are completing, or have recently completed, the following projects (estimated costs in parentheses): Enlarge abutments, repair piers and construct ice breakers on double-track bridge No. 23.86, near Waterloo, Neb. (\$87,000); alter railroad facilities in connection with construction of subway at Grand Island, Neb. (\$270,000); improve coach watering facilities at North Platte, Neb., (\$29,000); raise grade of track one foot and replace four-span pile approaches to T.P.G. bridge No. 4161, near Agnew, Neb., with two-span 20-ft. I-beam approaches (\$43,250); improve coach watering facilities at Cheyenne, Wyo. (\$27,400); construct 10,750 ft. of additional yard trackage in Green River, Wyo., and rearrange other facilities to relieve congestion and facilitate movement of freight (\$74,900); build 11,100 ft. of mine trackage to serve a new mine of the Clayton Coal Company, St. Vrains, Colo. (\$62,000); replace eightspan pile trestle, bridge No. 1.51, South Pass branch, near Rock Springs, Wyo., with one 80-ft. D.P.G. span and twospan pile trestle approach at each end (\$32,200); install improved facilities for watering coaches at Salt Lake City, Utah (\$42,500); construct 9,900 ft. of yard trackage and install air line and air compressor to facilitate movement of freight traffic and relieve congestion at the yard in Milford, Utah (\$78,850); replace five-span frame trestle, bridge No. 512.64, near Modena, Utah, with three 20-ft. ballast deck I-beam spans (\$32,-500); construct 2,100 ft. of track and 26-ft. extension to concrete arch culvert,

and rearrange signals to provide more flexible operation through the yard at Caliente, Nev. (\$40,000); replace threespan pile trestle, bridge No. 427.73, near Cloud, Nev., with 30-ft. I-beam bridge (\$24,227); construct 4,500 ft. of additional yard trackage to provide more room for handling expanded operations in the yard at Provo, Utah (\$28,300); construct 4,825 ft. of additional yard and industrial trackage at Idaho Falls, Idaho, and rearrange railroad facilities to provide for expanding operations in that area (\$48,000); extend present passing tracks 2,900 ft. at Payson, Utah, 3,600 ft. at Nephi, and 3,200 ft. at Parley (\$544,200); construct 5,825 ft. of additional trackage and rearrange railroad facilities at Bach, Idaho, to provide for Pacific Fruit Express cars and stock cars, thereby relieving the Idaho Falls yard of handling this equipment (\$39,-000); replace Gorton Creek flume, 813 ft. long, M.P. 49.63, near Wyeth, Ore., with new treated timber flume (\$23,-500); install 17 miles of automatic color light signals between M.P.s 96 and 113 (Paxton, Ore., to Metolius) (\$63,700); and install intercommunicating loudspeaking paging system of two master station control units with five loud speakers, 23 microphones and accompanying wire and cable, to expedite yard operations at Kansas City, Kan. (\$21,000).

The following jobs are to be completed by company forces in cooperation with private contractors: Construct 120ft. by 249-ft. one-story warehouse building and 29-ft. by 90-ft. office addition with necessary trackage for lease to industry, at Topeka, Kan., the warehouse being erected by the Douglas Construction Company, Topeka (\$250,000), and trackage by company forces (\$7,900); construct at Pocatello, Idaho, a 200-ft. inspection pit for servicing Diesel power units (company forces-\$42,000) erect a 60-ft. by 120-ft. addition to the motor car repair shop (Brennan & Cahoon, Inc., Pocatello-\$130,000); erect 150-ft. by 190-ft. one-story concrete warehouse building, with necessary trackage, at Dawson street and Fourth avenue, Seattle, Wash., for lease to industry, the warehouse being built by J. G. Watts Construction Co. (\$243,300) and the trackage by company forces (\$8,250); install a drainage system at Kansas City. Kan., to provide adequate drainage for flood waters (drain line and ditch construction by company forces-\$17,954; curb, gutters and catch basins by Union Construction Company-\$21,346); construct 49,650 sq. ft. of paving and install drainage in stockyards of Idaho Falls, Idaho (Arrington Construction Company -\$24,340) and rebuild 21 sheep pens (company forces-\$24,810); and construct two 33-ft. by 85-ft. two-story frame dormitories for male and female employees at Sun Valley, Idaho, and equip seven former barrack buildings for use dormitories. Morrison-Knudsen is building the frame dormitories (\$135,-500), while company forces did the work on the barrack buildings (\$103,-500). Furnishings and equipment for all

buildings cost \$42,500. A contract amounting to \$240,000 has been awarded to Peter Kiewit Sons Company for erection of a 52-ft. by 282-ft. one-story locker and toilet building in the locomotive department area of the shop yard in Omaha, Neb.

#### ABANDONMENTS

Division 4 of the Interstate Commerce Commission has authorized:

Atlantic Coast Line.-To abandon 20 mi. of branch line between Fairmount, N.C., and Chadbourn. The commission said "the volume of traffic involved is wholly inadequate to support profitable operations," and added that "the record ... does not reveal any source of new traffic."

Pennsylvania.-To abandon its Lyons Run branch, 3.8 mi., in Allegheny and Westmoreland counties, Pa. Abandonment is being expedited so the Pennsylvania Turnpike Commission can purchase the right-of-way for its western

#### FINANCIAL

Boston & Maine.—Acquisition of Lessors' Lines .- This road has been authorized by the I.C.C. to acquire the properties and franchises of its wholly owned subsidiaries and lessors, the Vermont Valley and the Sullivan County, which companies the B.&M. proposes to dissolve. The V.V. extends from Brattleboro, Vt., to Bellows Falls, 24 mi., and the S.C. from Bellows Falls to a point near Windsor, Vt., 25 mi. The transaction will involve no payment by the B.&M. other than surrender of the lessors' capital stock for cancellation. In the same report, the commission authorizes the B.&M. to assume liability for \$306,000 of first mortgage, sinking fund 4 per cent bonds of the V. V. Purpose of the acquisition is to simplify the corporate structure of the B.&M.

Western.—Trackage Great Rights.-The I.C.C. has approved this road's application to renew for 25 years its agreements with the Union Pacific and the Chicago, Burlington & Quincy, under which it uses 0.4-mi. of U.P. line; the C.B.&Q. passenger station; and about 2 mi. of the latter's track, all in Omaha, Neb. In the same report, the I.C.C. approved an application by the C.B.&Q. to renew a 1920 contract with the U.P. under which the Burlington operates over a U.P. line between Council Bluffs, Ia., and a point near the former's passenger station in Omaha, 2.7 mi. The latter agreement will continue through 1988.

Seaboard Air Line.—Extra Dividend.— This company has declared an extra dividend of 50 cents a share on the common voting trust certificates, payable December 31 to stockholders of record December 9.

Southern .- Acquisition .- This road has been authorized by the I.C.C. to purchase, for \$100,000, a 4.6-mi. segment of the Buffalo, Union-Carolina between Buffalo, S. C., and a point 1.6 mi. east of Union. In the same report the I.C.C. authorizes the Buffalo to abandon the remainder of its line, an "unproductive portion" of 14.2 mi., from the point east of Union to Pride, effective upon consummation of the purchase arrangement. In authorizing the purchase the commission's Division 4 differed from a recommended report by Examiner Jerome K. Lyle, who would have set the purchase price at \$75,000 (see Railway Age of July 16, page 65). The commission, however, refused to approve the asked price of \$150,000, and expressed belief that the price it set would "provide the Southern with a cushion against disappointment in the volume of traffic anticipated and in the maintenance of various specific services," i.e., switching and operation of spur tracks. Principal reason for revising the purchase price upward was the fact that the cost of employee protection will be assumed by the Buffalo, rather than letting part of this responsibility go to the Southern "as ordinarily would devolve upon the purchaser" in a purchase proceeding. Union Merchants & Manufacturers, Inc., owner of the Buffalo, expects to employ displaced employees in its textile mills.

#### **New Securities**

Application has been filed with the Interstate Commerce Commission by:

Peoria & Pekin Union.—To assume liability for \$2,500,000 series A first mortgage bonds, due January 1, 1975. The P.&P.U. proposes this issue to enable it to call for redemption on February 1, 1950, a like amount of first mortgage, series A, 5½ per cent bonds, due August 1, 1974, and callable February 1 at 104 1/6 per cent plus second interest. 104 1/6 per cent plus accrued interest from August 1, 1949. By creating the new series of first mortgage bonds to refund the existing series the road in its application expressed hope for a more favorable interest rate. The new issue, if approved, would be limited to \$3,000,000, of which only \$2,500,000 would be issued initially. They would be sold by competitive bids and there are sinking fund provisions.

Division 4 of the I.C.C. has authorized: Meridian & Bigbee River.—To assume liability for \$50,000 of trustee's certificates, bearing interest at 4 per cent, to finance repair of the Naheola bridge across the Tombigbee river in Alabama. The new certificates, to be dated November 1, 1949, and mature July 1, 1950, will be delivered to the Reconstruction Finance Corporation to evidence an advance of \$50,000 for bridge repairs.

#### **Dividends Declared**

Chicago Great Western.—5% preferred, accumulated, 311/4¢, payable December 29 to holders of record December 15.
Gulf, Mobile & Ohio.—50¢, payable January 10, 1950, to holders of record December 21.
Illinois Terminal.—20¢, quarterly, payable

B. R. Gould, director of labor relations of the Chesapeake & Ohio at Richmond, Va., has been appointed assistant to president of the Union at Pittsburgh, Pa. Mr. Gould was born at Concordia, Kan., on October 19, 1902, and was

## RAILWAY OFFICERS

### EXECUTIVE

Herbert W. Johnson, whose retirement as vice-president and comptroller of the Chicago, Burlington & Quincy, the Colorado & Southern, and the Ft. Worth &

Herbert W. Johnson

Denver City, with headquarters at Chicago, was reported in the Railway Age of November 26, was born on November 24, 1879, in Chicago, where he attended

B. R. Gould

graduated from the University of Kansas (A.B. 1923, Phi Beta Kappa) and Harvard University (M.B.A. 1925). He entered railroad service during the summer of 1918 as a track laborer on the Missouri Pacific and served that road during the summer of 1923 as roundhouse laborer. During the summer of 1924 Mr. Gould was a clerk for the Delaware, Lackawanna & Western. On January 1, 1927, he joined the C. & O. as assistant cost engineer, and from 1929 to 1936 was transportation inspector, becoming assistant terminal trainmaster in the latter year. He was appointed terminal trainmaster in 1939; assistant su-

perintendent in 1942, and division superintendent at Columbus, Ohio, in 1945. Mr. Gould served as director of labor relations of the C. & O. at Richmond from 1948 until his recent appointment with the Union.

Richard Parkhurst has been elected president of the Mystic Terminal Company, Boston & Maine waterfront operating subsidiary, and also general manager of marine terminals of the B.&M., effective January 1, 1950.

### FINANCIAL, LEGAL & ACCOUNTING

A. L. Church, executive assistant to the president of the Illinois Central at Chicago, who will become also secretary on January 1, as reported in the Railway Age of November 26, was born on December 7, 1894, at Amboy, Ill. He attended his home town high school and Coppins Commercial College, Dixon, Ill., entering I. C. service in 1912 as a clerk in the office of the master mechanic at Freeport, Ill. From 1913 to 1917 Mr. Church served successively as stenog-

A. L. Church

rapher in the office of the general superintendent at Chicago, and as secretary to I. C. general officers. He subsequently became secretary to the president, and in 1925 was appointed assistant chief clerk in the president's office, being advanced to chief clerk in 1931. After serving as office manager from April, 1940, to July, 1945, Mr. Church was named executive assistant to the president, which post he will retain in addition to his new duties as secretary. He is also secretary of the Chicago & Illinois Western and president of the Madison Coal Corporation.

William R. Althans, whose appointment as assistant general counsel, in charge of the Detroit office of the Chesapeake & Ohio's law department, was reported in the Railway Age of December 10, was born on June 27, 1908, at St. Louis, Mo. Mr. Althans attended the University of Michigan, receiving his A. B. degree from that institution in 1930 and his J. D. degree in 1932; while attending law school he served as editor of the University of Michigan Law Review. From 1932 to 1934 he was associated with the law firm of Goodenough, Voorhies, Long & Ryan at Detroit, and subsequently engaged in private practice in that city. In September, 1938, he entered the service of the Pere Marquette (now part of the C. & O.) as an attorney at Detroit. In March, 1943, he was appointed assistant general attorney at that point, being advanced in February, 1945, to general attorney, in which position he was serving at the time of his new appointment.

### OPERATING

R. A. Miller, trainmaster on the Southern Pacific at Fresno, Cal., has been appointed assistant superintendent, Sacramento division, at Sacramento, Cal., succeeding T. F. Custer, who is on sick leave.

A. L. Blaser, assistant superintendent of the Canadian Pacific at Wilkie, Sask., has been transferred in that position to the Kenora division, with headquarters at Fort William, Ont. He succeeds E. H. Lewthwaite, transferred to Field, B. C., to replace F. J. Malone, whose promotion to superintendent at Medicine Hat, Alta., was reported in the Railway Age of December 3. W. E. Brookwell, road foreman of engines for the Calgary division, has been advanced to assistant superintendent at Calgary, Alta., succeeding G. Meldrum, whose promotion to superintendent at Lethbridge, Alta., was also reported in the Railway Age of December 3. W. B. Knox, district safety agent, Saskatchewan district, at Moose Jaw, has replaced Mr. Blaser at Wil-

Charles Covel Chapman, superintendent of the Central Kansas and Colorado divisions of the Missouri Pacific Lines, with headquarters at Osawatomie, Kan., has retired after 50 years of service. He has been succeeded by V. C. Holpin, formerly superintendent of the Southern Kansas and Central divisions at Coffeyville, Kan. C. L. Christie, mechanical

consultant in the research department at St. Louis, Mo., has succeeded Mr. Halpin.

J. W. Myers, superintendent of the Chicago, Rock Island & Pacific's Western division, at Fairbury, Neb., has been appointed assistant to the general manager, with headquarters at Chicago. He is succeeded by Robert W. Anderson, trainmaster at Herington, Kan.

Howard H. Sparling, general manager for the Western region of the Canadian National, at Winnipeg, Man., has retired from railroad service. Appointed to succeed Mr. Sparling is D. V. Gonder, assistant general manager at Winnipeg. Mr. Sparling was born on November 18, 1883, at Rockwood, Ont., and began his railroad career in 1901 as an operator with the Grand Trunk (now part of the C. N.). He subsequently served in various positions until 1929, when he became superintendent of transportation of the C. N. at Edmonton, Alta. He be-

Howard H. Sparling

came division superintendent at that point in 1939, and in 1942 was appointed general superintendent of the Saskatchewan division at Saskatoon. Mr. Sparling was transferred to Edmonton in February, 1944, as general superintendent of the Alberta district, and in November of that year was made chief of transportation at Montreal, Que. In May, 1946, he was appointed assistant general manager of the Winnipeg region, at Winnipeg, becoming general manager of the Western region at that point in November, 1947.

### TRAFFIC

Walter M. Slavik, general freight agent in charge of sales and service in the Chicago territory for the Chicago South Shore & South Bend, has been appointed eastern traffic manager, with headquarters at New York, succeeding George B. Hubbard, retired. Mr. Slavik was born on April 12, 1908, in Chicago, where he received his education in the parochial grade and high schools. He was employed by the Central Freight Association and Illinois Freight Association

prior to entering the service of the South Shore in January, 1930, in the rates and divisions section of the traffic department. In December, 1939, he was promoted to commercial agent, and in May, 1946, was appointed general agent at Chicago. Mr. Slavik became general freight agent in charge of sales and service in May, 1948.

Charles W. Dickinson, general agent of the Illinois Central at Cleveland, Ohio, will retire on December 31, after more than 28 years of service. He will be succeeded by Jack H. Butridge.

Andrew Sutherland, assistant foreign freight agent, rates, of the Central region of the Canadian National, has been appointed assistant general freight agent, rates, tariffs and divisions, with system jurisdiction, having headquarters as before at Montreal, Que. William Hindle has been appointed assistant foreign freight agent, rates, at Montreal, also with system jurisdiction.

Clifford V. Harrow, whose promotion to freight traffic manager of the Erie at Chicago was reported in the Railway Age of November 26, was born on September 25, 1893, at Fremont, Neb., and attended high school at Omaha, Neb. He began his railroad career in 1912 as a clerk with the Baltimore & Ohio at Omaha, joining the Erie Dispatch (now Erie) in a similar position in 1914. Between 1919 and 1920, he was employed as a stenographer by the Union Pacific at Omaha, subsequently becoming chief clerk on the Erie at the same point. In

Clifford V. Harrow

1924 he was appointed commercial agent at Toledo, Ohio, and in 1927, general agent at Des Moines, Iowa, returning to Omaha as general agent in 1931. Five years later he was transferred to Minneapolis, Minn., and in 1941 was advanced to division freight agent at Rochester, N. Y., being named assistant general freight agent at Chicago the next year. Mr. Harrow became general eastern freight manager at New York in 1945, and returned to Chicago in 1946 as assistant freight traffic manager, which po-

sition he held at the time of his promotion.

Charles Edwin Johnson, district passenger agent of the Missouri Pacific Lines at Denver, Colo., has retired after 27 years of continuous service with the M. P.

D. G. Payne, general agent, passenger department, of the Chicago & North Western at Milwaukee, Wis., has been promoted to assistant general passenger agent at Chicago, succeeding H. G. Von Winkle, whose retirement was reported in the Railway Age of December 10. Succeeding Mr. Payne at Milwaukee is E. D. Poulson, district passenger agent at New York.

S. T. Allen has been appointed district passenger agent of the Seaboard Air Line at Cleveland, Ohio.

F. G. Altenburg, general agent of the New York, Chicago & St. Louis at Milwaukee, Wis., and Hendricks Easterday, general agent at Salt Lake City, Utah, have been appointed assistant general freight agents, with headquarters at Chicago, Clyde W. Jones, coal freight agent at Chicago, has become assistant coal traffic manager at that point. The title of K. S. Boreman, assistant freight traffic manager at Chicago, has been changed to freight traffic manager.

### MECHANICAL

John L. Robson, superintendent of motive power for the Great Northern at St. Paul, Minn., has been promoted to general superintendent of motive power at

John L. Robson

that point, succeeding Ira G. Pool, whose promotion to general manager was announced in the Railway Age of December 3. Mr. Robson was born in England, attended Montana State College and Yale University, and entered railroad service with the Northern Pacific at Livingston, Mont., in 1925. He subsequently joined the operating department of the G. N. and, following several assignments throughout the system, was appointed master mechanic at Grand Forks, N. D. In 1942 he became superintendent of motive power at St. Paul.

### ENGINEERING & SIGNALING

Alton V. Johnston, whose appointment as assistant chief engineer of the Central region of the Canadian National at Toronto, Ont., was reported in the Railway Age of December 3, was born at St. Thomas, Ont., in 1909. He began his railroad career with the C.N. in August, 1927, as a helper at Windsor, Ont., and subsequently held various positions at Jarvis, Ont., Tecumseh, St. Thomas, Niagara Falls, Thamesville and Cayuga until August, 1936, when he became bridge and building master at St.

Alton V. Johnston

Thomas. Mr. Johnston transferred to Stratford, Ont., in January, 1940, and was appointed assistant engineer at Belleville, Ont., in May, 1941, becoming division engineer at Hornepayne, Ont., in 1942 and transferring to the Belleville division in 1945. In August, 1946, he was appointed senior assistant engineer and in 1947 became office engineer of the Central region at Toronto, which position he held until he became assistant chief engineer of that region.

### SPECIAL

Henry J. Schulthess, chief of personnel of the Denver & Rio Grande Western, at Denver, Colo., for the past 13 years, left that post, effective November 1, to become vice-president of the Charles L. Baker & Co., personnel and management consultants, also at Denver, effective January 1. Mr. Schulthess started his railroad career as a machinist's apprentice with the Oregon-Washington Railroad & Navigation Co. (part of the Union P cific) in October, 1909, later working as machinist at Ogden, Utah. Starting in March, 1916, Mr. Schulthess worked successively in supervisory ca-pacities in the mechanical departments of the Oregon Short Line (U.P.) Southern Pacific, U.P., and Utah railway until 1920, when he went with the Railway Educational Bureau of Omaha. In this capacity he progressed employee educational and training programs for a large number of roads until 1936, when

he joined the Rio Grande to establish a personnel department for that road.

### OBITUARY

John Leslie, who retired in 1932 as vice-president in charge of finance, and treasurer, of the Canadian Pacific, died in Westmount, Que., last week in his 89th year.

William M. Ray, who retired in 1939 as senior assistant engineer of the Baltimore & Ohio at Pittsburgh, Pa., died on November 5 at his home in Wilkinsburg, Pa., at the age of 80.

Thomas P. Casey, who retired on September 1, 1948, as district freight traffic manager of the Chicago, Milwaukee, St. Paul & Pacific at New York, died on December 9 at St. Vincent's hospital, Montclair, N. J., at the age of 72.

Thomas E. Bond, who retired in November, 1946, as president of the Elgin, Joliet & Eastern, with headquarters at Chicago, died at St. Joseph's hospital in that city on December 9. Mr. Bond was born in Toledo, Ohio, on November 2, 1876, and entered railroad service in 1900 as a clerk in the traffic department of the Denver & Rio Grande (now Denver & Rio Grande Western). In 1905 he entered the industrial traffic field as a rate clerk with the Colorado Fuel & Iron Co., at Denver, Colo. Three years later he returned to railroad service as a clerk in the traffic department of the

Thomas E. Bond

E. J. & E. In 1914 Mr. Bond was advanced to chief of the tariff bureau of that road. In 1918 he was furloughed from the E. J. & E. to serve as assistant western traffic manager of the United States Food Administration. Upon the close of the war, he returned to railroad service as a member of the Western Freight Traffic Commission of the U. S. Railroad Administration. In 1920, when the railroads were released from government control, Mr. Bond returned to the E. J. & E. as assistant traffic manager. In 1923 he was promoted to traffic manager, and in 1932 was elected vice-president. He became president of the road in November, 1941.

### HYDRAULIC CAR-WHEEL BORER

The report which we received recently with a photograph of a Niles Hydraulic Car-Wheel Borer said simply: "Tools No. 44 Carb. tips. A cast wheel every 4 minutes. A steel wheel every 6 minutes."

We know of enough other shops that are also consistently turning out 60 or more wheels in eight hours to say that 300 wheels in a 40-hour week is entirely practical.

This Niles Hydraulic Car-Wheel Borer has a range of table speeds and feeds designed for carbide tools. After the desired speeds and feeds for roughing, finishing and chamfering are selected, they are automatically engaged at the proper time during the cycle. The cycle itself is entirely automatic, from movement of starting lever to return traverse of the boring bar and application of table brake. Wheels are chucked and unchucked by pressing buttons. Provision is made for hub facing, with hydraulic feed. (Attachment not in use when this photograph was taken.)

The Niles borer may be, and usually is, supplied with its own cranes—one, or one on each side—driven by separate motors and bolted to the machine frame. These cut loading and unloading time.

To date, 34 railroads and nine car and

locomotive builders have purchased 74 of these machines. We will be glad to help you make arrangements to see one in operation. Just call the Lima-Hamilton sales office in New York, Chicago, or other principal cities, or write direct to Lima-Hamilton Corporation, Hamilton, Ohio.

BACK OT A SQUIRT OF ARACAR 55 IS...

**OUR STAFF** of over 2000 research scientists and technicians working in the Esso Petroleum Labs — America's largest—to bring you fine railroad fuels and lubricants.

OUR SPECIAL test-equipped, two-unit 2700 hp Diesel locomotive that carefully checks Esso Railroad Products...searching for ways that Esso Fuels and Lubricants might improve the performance and economy of your railroad equipment.

our sales engineer who follows up the performance of Esso Railroad Products...helping railroads get better results by using the right fuels and lubricants. Remember, whenever any fuel or lubrication problem comes up—call in an Esso Sales Engineer.

### OPERATING REVENUES AND OPERATING EXPENSES OF CLASS I STEAM RAILWAYS

Compiled from 129 monthly reports of revenues and expenses representing 133 Class I steam railways (SWITCHING AND TERMINAL COMPANIES NOT INCLUDED)

DIESEL ENGINE LINERS AND PISTON

In high-speed Diesel engines lubricated with RPM DELO Diesel Engine Lubricating Oil, wear on liners was held to a minimum with little variation over their entire areas. A constant lubricating film was maintained on them even in high-temperature belts. RPM DELO Oils are recommended for all types of Diesels. Come in all viscosity grades necessary for your engines.

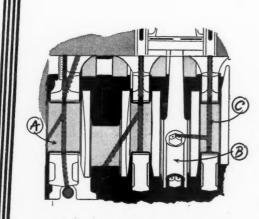

Case D119E-Reducing Wear on

Liners in Diesels

- A. Special additive provides metal-adhesion qualities...keeps oil on all parts whether hot or cold, running or idle.
- B. An anti-oxident resists formation of lacquer—resistance to extreme heat provides lubrication in the toughest conditions.
- C. Contains detergent which keeps rings clean and operating freely...prevents scratching and gouging of liners.

RPM DELO Diesel Oil will not corrode any bearing.

Case D119F—Prolonging The Lives of Diesel Bearings

SECTION OF DIESEL ENGINE CRANK AND CAM

No bearing failures occurred between overhaul periods in Diesel engines used in the toughest service when they were lubricated with RPM DELO Diesel Engine Lubricating Oil.

- A. Non-corrosive to all types of bearing metal...inherent ability of base stocks and added compound resist oxidation and formation of acid which is common cause of bearing corrosion.
- B. Maintains a tough lubricating film which withstands excessive shocks and pressures.
- C. Special detergent compound keeps oil passages clean and open - allows free flow of lubricant to vital points.

Another compound in RPM DELO 0il prevents foaming of the oil. An accurate measurement of crankcase levels can always be obtained.

# CONSERVE ROLLING STOCK, YARD and Right-of-Way EQUIPMENT with

- Protects against rain and moisture
- Protects against salt brine
- Protects against acid and alkali fumes
- Odorless
- Non-toxic
- Vermin-proof

One application of this tested coating is far superior to paints and cut-back asphalt products. It's the most practical, low-cost rust preventative for roofs, interiors and underframes of steel freight and refrigerator cars, covered hopper cars used for soda ash, lime and similar products, ice bunkers and equipment exposed to acid fumes and gases.

It's tops for steel bridges, cooling system ducts and sumps, outside storage tanks, tool houses and bins.

Will not run, sag, blister or craze at temperatures up to 250° F.

### **EASY TO APPLY**

Mortex No. 4 can be put on with brush, trowel or spray. It adheres to any clean, dry surface and forms a rich, dull black finish.

### TRY IT YOURSELF

Most railroads get Mortex No. 4 in 55 gallon drums, but you can order either a 1-gallon or a 5-gallon can and put it through your own comparative tests.

### GENERAL NEWS

(Continued from page 72)

### Department of Agriculture Enters Ogden Gateway Case

The Secretary of Agriculture has been permitted by the Interstate Commerce Commission to intervene in the so-called "Ogden Gateway" case, No. 30297, in which the Denver & Rio Grande Western is seeking to have the commission force open the Ogden, Utah, gateway by requiring the Union Pacific to participate in joint through rates via that gateway on traffic between Colorado common points, or points east thereof, and points in Montana, Oregon, Washington, and British Columbia.

In the petition for permission to intervene, the Agriculture department noted that Congress has made it the duty of that department to study the cost of agricultural marketing. "Large quantities of agricultural products are produced in and distributed from, to, and within the traffic territory in this complaint," the petition said, and the Secretary of Agriculture should be permitted to intervene "to foster and protect such interests of his concern as may be involved in the proceeding."

### October Truck Traffic

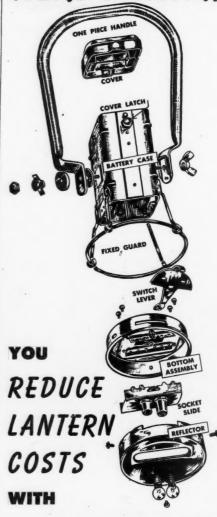

Motor carriers reporting to the American Trucking Associations transported in October 3,380,224 tons of freight, a decrease of 1.6 per cent below the prevvious month's total of 3,433,536 tons but 4.4 per cent above the 3,238,794 tons hauled in October, 1948. The figures, according to the A.T.A., are based on comparable reports from 319 carriers in 42 states.

### Industrialization of Southeast Discussed at Shippers' Meeting

"Far from being economic problem No. 1, the South today is the nation's economic opportunity No. 1," was the cpening keynote of the 88th meeting of the Southeast Shippers Advisory Board, sounded by C. L. Denk, Jr., chairman of the board and general traffic manager of Fulton Bag & Cotton Mills, Atlanta, Ga. Mr. Denk stated that the Southeast leads all other sections of the country in car loadings (other than coal) for 1949 and that this lead would be maintained in the foreseeable future. This optimistic prediction was bolstered by Lucien Bauduc, traffic manager, South Coast Corporation, New Orleans, La. and J. C. Sanford, traffic manager, Chicago Bridge & Iron Co., Birmingham, Ala.

The meeting, held at Orlando, Fla., was featured by a banquet on December 7 and a luncheon on December 8, given under the auspices of the Central Florida Traffic Club. W. T. Pentzer, principal horticulturist, U. S. Depart-

# HERE'S WHY ...

## JUSTRITE ELECTRIC LANTERNS

### PARTS EASILY REPLACED

Damaged parts easily and quickly removed. Replacement "on the job" can be made with standard parts.

### NO SPECIAL TOOLS REQUIRED

Note screw type assembly illustrated above.

### SIMPLIFIED SWITCH DESIGN

No wiring to get out of order.

### **BUILT OF FINEST MATERIALS**

Designed to withstand rough usage under all service conditions.

### California Commission Fixes Number of S. P. Brakemen

Acting under the state's "excess crew" law, as amended by state-wide referendum in the general election of November 2, 1948, the Public Utilities Commission of California has ordered the Southern Pacific to provide "at least one conductor and three assigned brakemen' on through freight trains between Alturas and Wendell; Alturas and the Oregon line; Dunsmuir and the Oregon line, on two routes; Dunsmuir and Gerber; Roseville and the Nevada line, and Los Angeles and Indio, Bakersfield and San Luis Obispo. A third brakeman, "who may be an extra man not as-

signed," was ordered between San Luis Obispo and Santa Marguerita.

The commission recommended that the S. P. be permitted to operate through freight trains on its other California lines with a cenductor and two brakemen. About local freight it said:

"Because of the many variables existing in this service, such as changing conditions and changing volume of traf-fic, it was recommended that no hard and fast rule as to the necessity for a third brakeman on local freight trains could practicably be formulated, but rather that the matter be left to the discretion of the . . . company . . . . "

The recommendation referred to was

one made by the commission's Operations-Safety division, which was not contested by the railroad, and on which the commission's entire order, No. 43555, was based. Prior to the 1948 election, the state's "excess crew" law had required from three to nine brakemen on all freight trains operated in California, according to arbitrary standards determined by track grades and train lengths. The amendment approved by the voters gave to the commission responsibility for determining the number of brakemen required. (See Railway Age of October 23, 1948, page 41, and November 13, 1948, pages 36 and 59.)

# Pace Your DIESELS Valve Pilot Precision

VALVE PILOT DIESEL SPEED RECORDERS are noted for their unfailing accuracy over hundreds of thousands of miles. They are important aids in profitable Diesel operation. These dependable instruments are of vital help in keeping your passenger and freight schedules "on the beam." They are available for every make of road Diesel.

For the complete story of Diesel performance, "DIESEL-OMETER" PRODUCTS, Valve Pilot Diesel Operation Recorders are filling a vital need. In addition to speeds, these instruments record pertinent details of throttle, reverse and transition lever operation, dynamic braking, automatic train signal forestalling, etc. Here in one "package" you have the key to better, more profitable use of your Diesel investment. Write for full particulars.

### **Current Publications**

### **PAMPHLETS**

Style Manual for American Standards. 28 pages. Published by the American Standards Association, Inc., 70 E. 45th st., New York 17. \$1.

Believing that standardization applies to publication of standards as well as to materials, manufactured products, and replacement parts, the American Standards Association has just published this style manual. It is a guide to bring about greater uniformity in presentation of technical data, particularly in those generally agreed upon standards which have been given approval as "American Standard." Although primarily intended for use by technical committees working under the procedure of the association, the manual contains recommendations and suggestions which may be helpful to any organization responsible for editing and publishing technical documents.

Rails and Ideals—in U.S.A. and Canada, by R. W. Brown. 32 pages. A Newcomen address delivered at the 1949 Canadian Dinner, Royal York Hotel, Toronto, Ont., October 6. Printed by the Princeton University Press, Princeton, N. J.

This address dealt with the common heritage and ideals of the railroads in the United States and Canada, and their contributions to their respective national economies. Mr. Brown (president of the Reading)

also discussed the place of government in transportation and business, using as examples the various types of transportation enterprises that have been set up from time to time in both countries.

Charles Edward Wilson, American Industrialist, by Kent Sagendorph. 50 pages. Published by the General Electric Company, Schenectady, N. Y.

A biography of Mr. Wilson published on the 50th anniversary of his first employment with General Electric.

Statistics of Class I Motor Carriers for the Year Ended December 31, 1947. 113 pages. Prepared by the Bureau of Transport Economics and Statistics, Interstate Commerce Commission. Available from the Government Printing Office, Washington 25, D. C. \$1.

Contains financial and operating statistics of motor carriers of property and motor carriers of passengers filing reports with the I.C.C.

Inside Northern Maine. 48 pages, illustrations. Published by the Bangor & Aroostook, Bangor, Me. Free.

The Bangor & Aroostook has dedicated this well-produced and well-illustrated booklet to the people of Northern Maine, and to the agricultural, industrial and recreational interests of the territory as a whole. Following a brief history of the railroad, there are chapters on the potato and potato

starch industries, pulpwood and paper-making, raising beef cattle, dairying, commercial fertilizers, fishing, frozen foods, soil conservation, hunting, educational facilities, hardwoods and softwoods of Northern Maine and the port of Searsport.

### BOOKS

Review of Current Research and Directory of Member Institutions, 1949. 186 pages. Published by the Engineering College Research Council of the American Society for Engineering Education. Available from F. M. Dawson, College of Engineering, State University of Iowa, Iowa City, Iowa. \$1.75.

Lists, by title, 4,000 current college and university research projects in engineering subjects, representing expenditures of over \$35,000,000. Entries from 82 educational institutions which hold membership in the Research Council describe the administrative policies for conducting engineering research and list the responsible personnel, research expenditures, short courses and conferences of special interest, and the titles of all engineering research studies currently active at each institution. Use of the volume is facilitated by a breakdown of research projects according to the engineering departments involved, and by a complete index to research project subjects. A number of those listed will be of interest to railroad engineers.

The Original 1879 Car-Builder's Dictionary's Illustrations, Car Plans and Advertisements, compiled for the Master Car-Builders' Association by Matthias N. Forney. 491 pages. Republished by Simmons-Boardman Publishing Corporation, 30 Church st., New York 7. \$3.95.

In 1879 a notable event took place in American railroading that was to have far reaching results, not only in that year but right down to the present day. That event was the appearance of the Master Car-Builders' Association's first Car-Builder's Dictionary, the volume that standardized for all time names of railroad car parts. It was also one of the first books to present completely detailed illustrations and diagrams of railroad car equipment in service in that period of railroad development. The original illustrations, car plans, and advertisements that appeared in that early work are reproduced here for the thousands of model makers, railroad historians, and rail enthusiasts who know and appreciate authentic American railroadiana.

Cost-Ripping Ribbon Rail. Investor's Reader. November 9, 1949, pp. 20-22. Available from Merrill Lynch, Pierce, Fenner & Pagna 70 Pine et Nove Vol. 5

Beane, 70 Pine st., New York 5.

A concise article, based upon information supplied by Oxweld Railroad Service Company and supplemental data obtained by the editors, refers to recent installations of pressure butt-welded rail on the railroads of the country, and features claimed savings in track maintenance costs through this type of construction, based largely upon experience of the Elgin, Joliet & Eastern and the Delaware & Hudson.
